from cold strip
to finished shapes
IN SECONDS!

YODER ROLL-FORMING MACHINES

If you are in the business of manufacturing a product that is, or could be, made wholly or partly from flat rolled metals in thicknesses up to $\frac{1}{2}$ ", a Yoder Roll-Forming machine can help reduce your production costs.

Cold-formed shapes of every description—including structurals, tubular products, moldings, trim, roofing and siding, panels, cabinet shells, etc., can be produced on Yoder cold-roll forming equipment at the rate of 25,000 to 50,000 feet per day at a conversion cost of only a fraction of a penny per foot! With speeds and costs such as this, even part-time operation of a Yoder roll-forming line is a profitable investment!

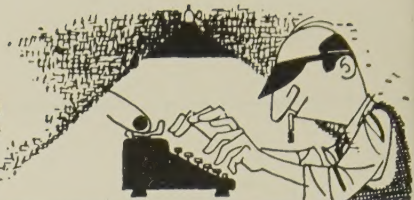

Additional operations such as welding, coiling, ring forming, perforating, notching, embossing or cutting to length can be simultaneously introduced to the basic shape at little or no additional labor cost. Yoder engineers are at your service in explaining the advantages of roll-forming for your individual needs.

A new, revised, Fifth Edition of the Yoder Cold-Roll Forming book is just off the press. In addition to economic and mechanical possibilities of cold-roll forming, it contains numerous illustrations of end uses and applications of roll-formed shapes. Write for your copy today.

behind the scenes

Birth of a Feature

The story you are about to read is true; only the names have remained unchanged to protect the innocent.

It was 8:33 a.m., Friday, Aug. 9. Al Gray, technical editor, was working out of the Technical Section. His partner, Associate Editor Austin Brant, unaware of the partnership, was wondering where he could pick up a cheap used guitar. Their boss, Editor Walt Campbell, was two doors down the hall, chewing a 6-ounce cigar. Gray decided to write a letter to Campbell. This was a particularly shrewd move because no investment in postage was required.

"Dear Walt," he wrote. True, he could have shouted this greeting over the transom, but our editors don't operate that way. They are trained to communicate by typewriter. "Here is a Prospectus for a Special Report on Stainless Steel. This 16-page article is planned as a joint project of the entire editorial staff and the market research department and will bring users and producers up to date on the potential of the material."

10:30 a.m.: Campbell received the letter by interoffice mail. Pat Kearney, the young gentleman who delivered it, set the envelope down tenderly—not because he was impressed but because the stump of his index finger, lost in the armed services, was extra sensitive that morning.

8:33 a.m., six days later: Campbell answered the letter. He expressed the hope that the stainless study would prove to be the first of a whole family of penetrating reports on basic materials. He closed with best regards, and in the course of that same afternoon Kearney delivered the reply to Gray. "Wonder what they'd say in Scranton," young Mr. Kearney muttered, "if they knew I carried letters back and forth between two guys who can see each other from their own offices?"

The Stainless Story

The special report fell into four major areas: Trends in production and distribution; trends in user thinking; trends in application; trends in design and fabrication. When the copy came flowing in from STEEL's editors

here and everywhere, Brant and Copy Editor Harry Chandler endeavored to whittle it down to 16 pages. For a time, as varied reports came tumbling in, Chandler thought he was in the middle of a Chinese fire drill.

Meanwhile, back at the ranch—or rather, the Art Dept.—Art Director Bill Kellogg was planning STEEL's cover from a transparency generously supplied by Murrin Held, Public Relations Dept., Allegheny Ludlum Steel Corp.

The illustration, printed in three colors, shows a mess of stainless steel being cooked up in an electric arc furnace, only you can't see it, and it really isn't being cooked. While stainless steel is an important metal today, it hasn't been established too long. Everybody except the Russians seemed to have had a hand in inventing it. In 1865, a Mr. Bauer in Brooklyn sought a patent for a chromium steel alloy he devised. He sold his product, strangely enough, in the form of stainless steel safes and jail bars, but we have no record of the reaction of safe-crackers and jailbreakers to these unsporting restraints.

Englishmen, Germans, and Americans worked on such things as gun barrels, cutlery, pyrometer tubes, and the effects of chromium on oxidation resistance in the years before World War I. Out of their experiments have come the stainless steels of today. The tremendous and comprehensive report on this remarkable metal begins on Page 107 and continues for 16 pages.

How Not To Get Ahead

Three efficient headhunters raided a village and obtained a splendid haul because it was the siesta hour and nobody woke in time. After stacking the loot in an imposing pile, they agreed to let each man take as many heads as he had wives. Mbongo took three more heads than Mbango, while Mbongo took twice as many as Mbongo, which gave him 11 more than Mbango. How many heads were in the pile?

insurance?**

"Of course I am!"

**"I know my family's future depends
on the future of my husband's business — whether he lives or dies."**

Every wife is interested in the future of her husband's business — whether he is owner, partner, stockholder or key executive. And the future of that business may well depend on adequate business life insurance.

Death can bring financial chaos to any business — and extreme hardship to the families involved.

BUT . . . an Aetna Business Life Insurance Plan can prevent this — can provide in advance for a smooth and orderly transfer of the business.

Easiest, fastest way to kill fire... KIDDE NEW DRY CHEMICAL EXTINGUISHER

Here — from Kidde — is the newest, the fastest, the easiest-to-operate dry chemical fire extinguisher!

Look at the extra large, aluminum handle and trigger — even a gloved hand fits comfortably with room to spare. Pick the unit up — it hangs straight — no awkward angle to throw you off balance.

If fire strikes, follow the simple directions: "Remove Horn" — automatically the trigger safety lock is released — "Pull Trigger" — instantly a cloud of fire-killing dry chemical whooshes out of the nozzle and fire's out! With this unit, designed by Kidde engineers working with Henry Dreyfuss personnel, you don't have to be a trained fireman to get perfect results.

Built for a lifetime of use, the handsome, new 20 and 30 pound Kidde dry chemical extinguishers have top ratings from Underwriters' Laboratories, require only 225-250 psi charging pressure. The rugged pressure gauge is recessed in handle for maximum protection. Tells at a glance if the unit is ready for use.

Available nationally through Kidde's sales and service organization. Write Kidde today for the name of nearest distributor.

LETTERS TO THE EDITORS

Useful for Rapid Comparison

We would appreciate two copies of STEEL's Brazing Alloy Selector (Oct. 7, Page 162). This excellent compilation is most useful for rapid comparison in the wide range of brazing filler metals covered.

Should the need arise, would it be possible to obtain reprints in larger numbers, perhaps a hundred?

F. C. Brosnan
Engineering Div.
Handy & Harman
New York

• Yes. Write to Miss June Schilens, Reprint Dept., STEEL, Penton Bldg., Cleveland 13, Ohio, for information.

I would appreciate a reprint of the Brazing Alloy Selector. The tables will be an invaluable aid in our procurement work.

R. A. Weckstein
Manager-Purchasing
G-V Controls Inc.
East Orange, N. J.

Make-or-Buy Problem

Kindly furnish three copies of the extremely informative article, "Make or Buy?" (Oct. 14, Page 105). I would like to place copies in the hands of others in our organization.

John S. Wheeland
Purchasing Agent
Anchor Coupling Co. Inc.
Libertyville, Ill.

I have read your ninth Program for Management article ("Make or Buy?") and would appreciate receiving copies of other articles in the series. I am particularly interested in the article on research.

The series makes an excellent contribution.

John Motto
Product Development Engineer
Bohn Aluminum & Brass Corp.
Detroit

Your 1957 Program for Management has proved interesting and helpful. I'd appreciate copies of the nine articles published so far.

R. P. Scott
Vice President
General Blower Co.
Morton Grove, Ill.

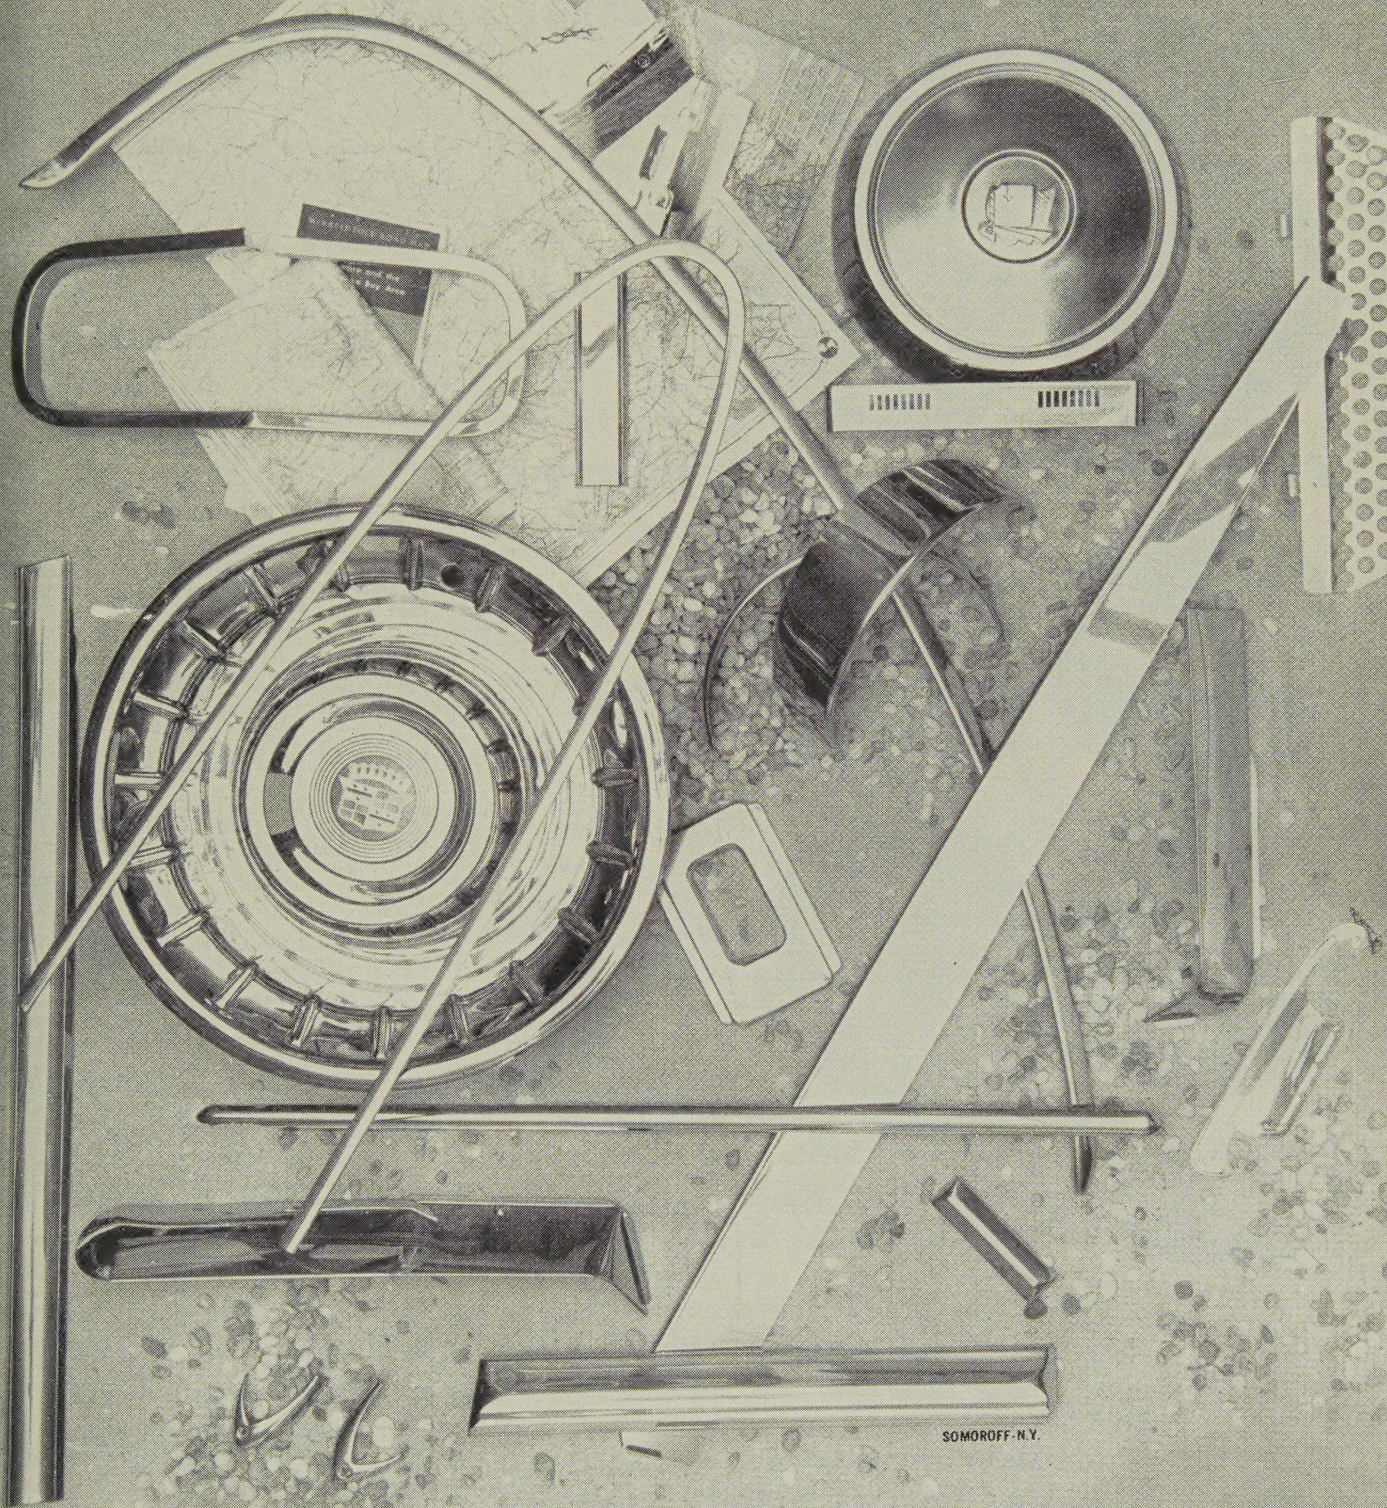

Better Bosses Wanted

Would you be kind enough to send me a copy of the article, "How To Be (Please turn to Page 12)"

TIPS ON USING RIVETS

A short design course guaranteed to save a lot of grief later on!

You could memorize these and thousands more design tips on the best use of rivets—but don't! Much simpler to call on Milford for the right answers to all your riveting design and application problems. Full-tubular, semi-tubular, split, cutlery, decorative—Milford makes them all from any metal that can be cold-formed, then adds a wide variety of platings and finishes.

To improve product appearance and strength
... to take full advantage of automatic assembly
... to cut delivery time and production costs

—get in touch with Milford first!

Management Article Pleases

Enjoyed your article, "Management's First Line" (Oct. 14, Page 76). I would like two copies.

J. D. Goodall
Assistant to the President
Northwestern Steel & Wire Co.
Sterling, Ill.

Please send eight reprints of the article, "Management's First Line." I found it interesting and know it will be of interest to our department supervisors.

R. L. Kelley
Plant Manager
Damascus Tube Co.
Greenville, Pa.

CALENDAR OF MEETINGS

Nov. 2-8, American Society for Metals: Annual meeting, Palmer House, Chicago. Society's address: 7301 Euclid Ave., Cleveland 3, Ohio. Managing director: William H. Eisenman.

Nov. 2-8, National Metal Exposition and Congress and World Metallurgical Congress: International Amphitheatre, Chicago. Information: American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio. Managing director: William H. Eisenman.

Nov. 3-8, Society for Nondestructive Testing: Annual meeting and international conference on nondestructive testing, Hotel Morrison, Chicago. Society's address: 1109 Hinman Ave., Evanston, Ill. Secretary: Philip D. Johnson.

Nov. 4-5, Wire Reinforcement Institute Inc.: Annual fall meeting, Safari Hotel, Scottsdale, Ariz. Institute's address: National Press Bldg., Washington 4, D. C. Managing director: Frank B. Brown.

Nov. 4-6, American Institute of Electrical Engineers: Machine tool conference, Hotel Schroeder, Milwaukee. Institute's address: 33 W. 39th St., New York 18, N. Y. Secretary: N. S. Hibshman.

Nov. 4-6, American Institute of Mining, Metallurgical & Petroleum Engineers: Institute of Metals Division meeting, Morrison Hotel, Chicago. Institute's address: 29 W. 39th St., New York 18, N. Y. Secretary: E. O. Kirkendall.

Nov. 4-8, Society of Automotive Engineers: Fuels and lubricants, transportation, and diesel engine meetings, Hotel Statler, Cleveland. Society's address: 485 Lexington Ave., New York 17, N. Y. Secretary: John A. C. Warner.

Nov. 6-8, Grinding Wheel Institute and Abrasive Grain Association: Annual meeting, Sheraton-Blackstone Hotel, Chicago. Information: Hunter-Thomas Associates, 2130 Keith Bldg., Cleveland 15, Ohio.

Nov. 6-8, Scientific Apparatus Makers Association: Midyear meeting of laboratory apparatus and optical sections, Edgewater Beach Hotel, Chicago. Association's address: 20 N. Wacker Dr., Chicago 6, Ill. Executive vice president: Kenneth Andersen.

Nov. 6-8, Porcelain Enamel Institute: Annual shop practice forum. Ohio State University, Columbus, Ohio. Institute's address: 1145 19th St. N.W., Washington 6, D. C. Secretary: John C. Oliver.

Nov. 8, American Iron & Steel Institute: Regional technical meeting, Mark Hopkins Hotel, San Francisco. Institute's address: 150 E. 42nd St., New York 17, N. Y. Secretary: George S. Rose.

Nov. 7-8, National Foundry Association: Annual meeting, Waldorf-Astoria Hotel, New York. Association's address: 53 W. Jackson Blvd., Chicago. Executive secretary: Charles T. Sheehan.

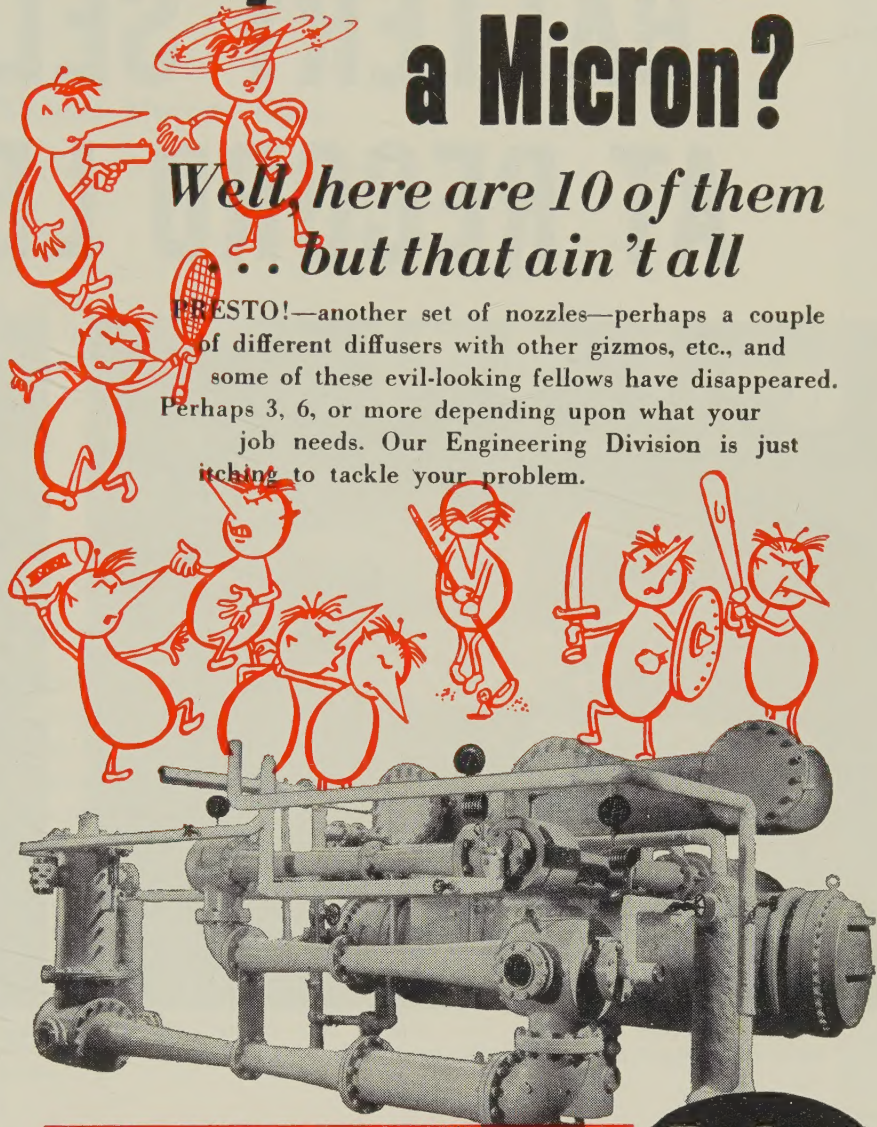

Nov. 11-13, Steel Founders' Society of America: Technical and operating conference, Carter Hotel, Cleveland. Society's address: 606 Terminal Tower, Cleveland 13, Ohio. Secretary: George K. Dreher.

Nov. 11-15, National Electrical Manufacturers Association: Annual meeting, Traymore Hotel, Atlantic City, N. J. Association's address: 155 E. 44th St., New York 17, N. Y. Managing director: Joseph F. Miller.

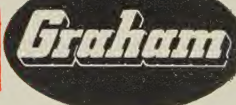

Did you ever **SEE** a Micron?

*Well, here are 10 of them
... but that ain't all*

PRESTO!—another set of nozzles—perhaps a couple of different diffusers with other gizmos, etc., and some of these evil-looking fellows have disappeared. Perhaps 3, 6, or more depending upon what your job needs. Our Engineering Division is just itching to tackle your problem.

Graham multi-stage ejector capable of sustaining these low absolute pressures

Through constant and intelligent research, Graham has refined the steam and gas propelled ejector until some would say that we had reached the ultimate—from our viewpoint, not so—we intend to go further. Our progress cannot halt—and to any industry that has a need for this exclusive equipment, we are prepared to demonstrate our guarantees.

We invite you to submit your problem to our Engineering Department without obligation and learn the economies and many advantages of the Graham Ejector for absolute pressures that are practically nil.

GRAHAM MANUFACTURING CO., INC.

NEW TG EXIDE-IRONCLAD BATTERY SELLING AT RECORD LEVELS

Keeping up with sales. The busy shipping floor at the Exide plant. High volume production insures prompt delivery on all orders.

New tubular construction of positive plate. Holds more active material, gives you highest capacity per cubic inch of any industrial truck battery.

Electric industrial truck users buying it up for "greater economy" and "more power" advantages

Introduced only last April, the new TG Exide-Ironclad Battery is already selling at a faster rate than previous model Exides ever did in a similar period. Indications are that it is on its way to being the biggest selling electric industrial truck battery in history.

Experienced electric industrial truck users are the major buyers—the men who know batteries and see in the TG more value for

their money. But in addition, there are truck users who are switching to this TG Exide-Ironclad Battery from cheaper but less economical makes.

If you want maximum economy and better performance in the operation of your electric industrial trucks, get the new TG Exide-Ironclad Battery. You can have more capacity in the same size or the same capacity in a smaller

size at a lower cost. Call your nearby Exide representative. Or write for detailed bulletin. Exide Industrial Division, The Electric Storage Battery Company, Philadelphia 2, Pa.

Exide[®]

The Electric Storage Battery Company

Metalworking Outlook

Next Round in Bethlehem Merger Case

Hearings on the arguments in the Bethlehem-Youngstown merger case are scheduled to begin today (Nov. 4). The government seeks, and the two steel companies oppose, a summary judgment barring the proposed merger. Judge Edward Weinfeld (U. S. District Court, Southern District of New York) may decide by about December. If the U. S. wins, the matter will be taken to the Supreme Court by the defense, a move which would delay a decision at least another year. If the steel firms win, a full trial, before Judge Weinfeld, will result. Final disposition could extend beyond 1958.

Experiment in Indiana

Take a look at the steel industry's plan to get around Indiana's law that prohibits state jobless pay to workers receiving Supplemental Unemployment Benefits (SUB). Under the plan, a worker in Indiana without dependents and earning \$2.725 an hour can draw \$58 a week in SUB alone, compared with \$25 a week in SUB and \$35 a week in state payments for a worker in Pennsylvania which has no anti-SUB law. In Indiana, that arrangement can last until excess in payments over the normal maximum (to employees in states like Pennsylvania) reaches 2 per cent of a company's SUB accumulation in all states. Then an alternate method starts: The worker draws state aid of \$33 weekly for three weeks, then an SUB payment of \$133 for the fourth week. The Pennsylvania setup of \$60 weekly in state and SUB payments lasts for 30 weeks; then state payments stop and an SUB payment of \$47.50 weekly lasts for 22 weeks. In Ohio, the other major problem state, a court ruling is sought to permit conventional SUB operation.

Labor Looks to 1958 for New Laws

The AFL-CIO wants these programs passed next year by Congress: Minimum wage of \$1.25 an hour, federal aid for school construction, financial disclosure of welfare and pension plans, tax cut for middle and low income groups, depressed area legislation, a federal dam at Hells Canyon, a housing program resulting in 2 million starts a year, improved civil rights legislation. Except for the welfare disclosure bill, the programs have little chance of passage.

Investments in Missiles

Air Materiel Command reports that industry has put up \$1 for every \$2 invested by the government for facilities to produce the Atlas, Titan, and Thor. Most of the aircraft industry's money has been used for seven new plants. Air Force funds were used for machine tools and related

Metalworking

Outlook

production equipment, for laboratory and test apparatus, and for test stands near contractors' plants.

Mobile Plant for Liquid Oxygen

Air Products Inc. has built a mobile liquid oxygen plant to provide fuel for the Army Redstone missile. The facility will produce 20 tons per day and is mounted on four truck-drawn trailers.

The Committee Way of Life

Committees are becoming a way of corporate life, according to an American Management Association survey. Two-thirds of the respondents report their companies have more committees today than they did five years ago. Eighty-nine per cent of the respondents say their committees exchange views and information. Other functions listed: Make recommendations, generate ideas, make major decisions. Committees also have more power today, the survey reveals. One-fifth of the respondents want more authority for committees. Three-fourths think they have enough now.

Pittsburgh-Erie Canal?

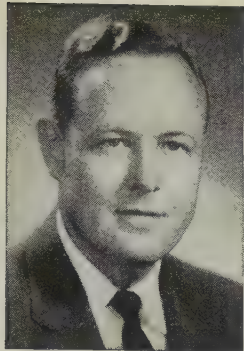

The Pennsylvania State Planning Board has revived an idea for a \$100 million Pittsburgh-Erie canal, to tie in with the St. Lawrence Seaway. First advanced in George Washington's day, the proposal would open a new water route for western Pennsylvania—down the Ohio and Mississippi Rivers to New Orleans. A New York engineering firm is studying routes, updating an Army study on the canal made during World War II.

Straws in the Wind

U. S. Steel Corp.'s order backlog on Sept. 30 was 6.4 million tons, compared with 6.9 million on June 30 and 8.1 million on Sept. 30, 1956 . . . Salary levels of engineering, scientific, and administrative employees in industry rose an average of 5.9 per cent between June, 1956, and June, 1957, says the American Management Association . . . Union membership now totals 18.5 million.

Air Power Notes of the Week

The Air Force says a choice will soon be made between Boeing and North American as the airframe contractors for Project WS-110, the long range, supersonic bomber for the Strategic Air Command. A chemically fueled bomber with six engines (reportedly to be built by General Electric), it would replace the B-52 . . . An Army general was ordered to delete from a speech: "Interceptor aircraft are obsolete; usefulness of bomber aircraft will fade. The Nike-Ajax can kill any bomber that flies; the Nike-Hercules, whole formations of planes" . . . Air Materiel Command says: "We have nearly exhausted our bag of manufacturing tricks and must overcome the knowhow barrier to build air weapons capable of speeds in excess of Mach 20."

November 4, 1957

Don't Run for the Hills!

Mark Twain once said that pessimism is the wisdom of men with weak nerves.

His observation reminds us of the apprehension being expressed by a good many men in business. They are unduly disturbed by fluctuating stock prices, the launching of sputnik, declining orders, and shrinking profits.

Their thinking runs something like this: "Business is bad and probably will get worse. Let's run for the hills and wait and see what happens."

Businessmen with stronger nerves take the leveling off more philosophically (see Page 65). They say: "Now that business is only wonderful, a lot of people are all steamed up because it is not spectacular. Organizations doing twice as much business as they did a couple of years ago are upset because they had forecast they would do two and a half times as much. We have been spoiled."

We can readily sympathize with a run-for-the-hills complex but not condone it. For most companies, sales and profits have been curving upward for one, perhaps two, decades. Sales came easily. Salesmen lost the art of selling and simply became order takers. With a rapidly growing population and ever-higher standards of living, it was felt there could be no course but upward.

Such thinking triggered a lot of expansion. It, in turn, brought about the situation we face now: Momentarily, the nation's productive capacity is greater than its ability to consume.

We agree with those who take the philosophical view. With all the facts in proper perspective, they are convinced that less than capacity operations and smaller new order books need not be disturbing. The growth factor in the economy is still present.

As we see it, the problem is to avoid standing still or retrenching at a time like this. We must recognize the plateau for what it is and keep right on building for the future. We must keep pace with the flood of new production processes, new equipment, new products, and new marketing methods resulting from our research and development programs.

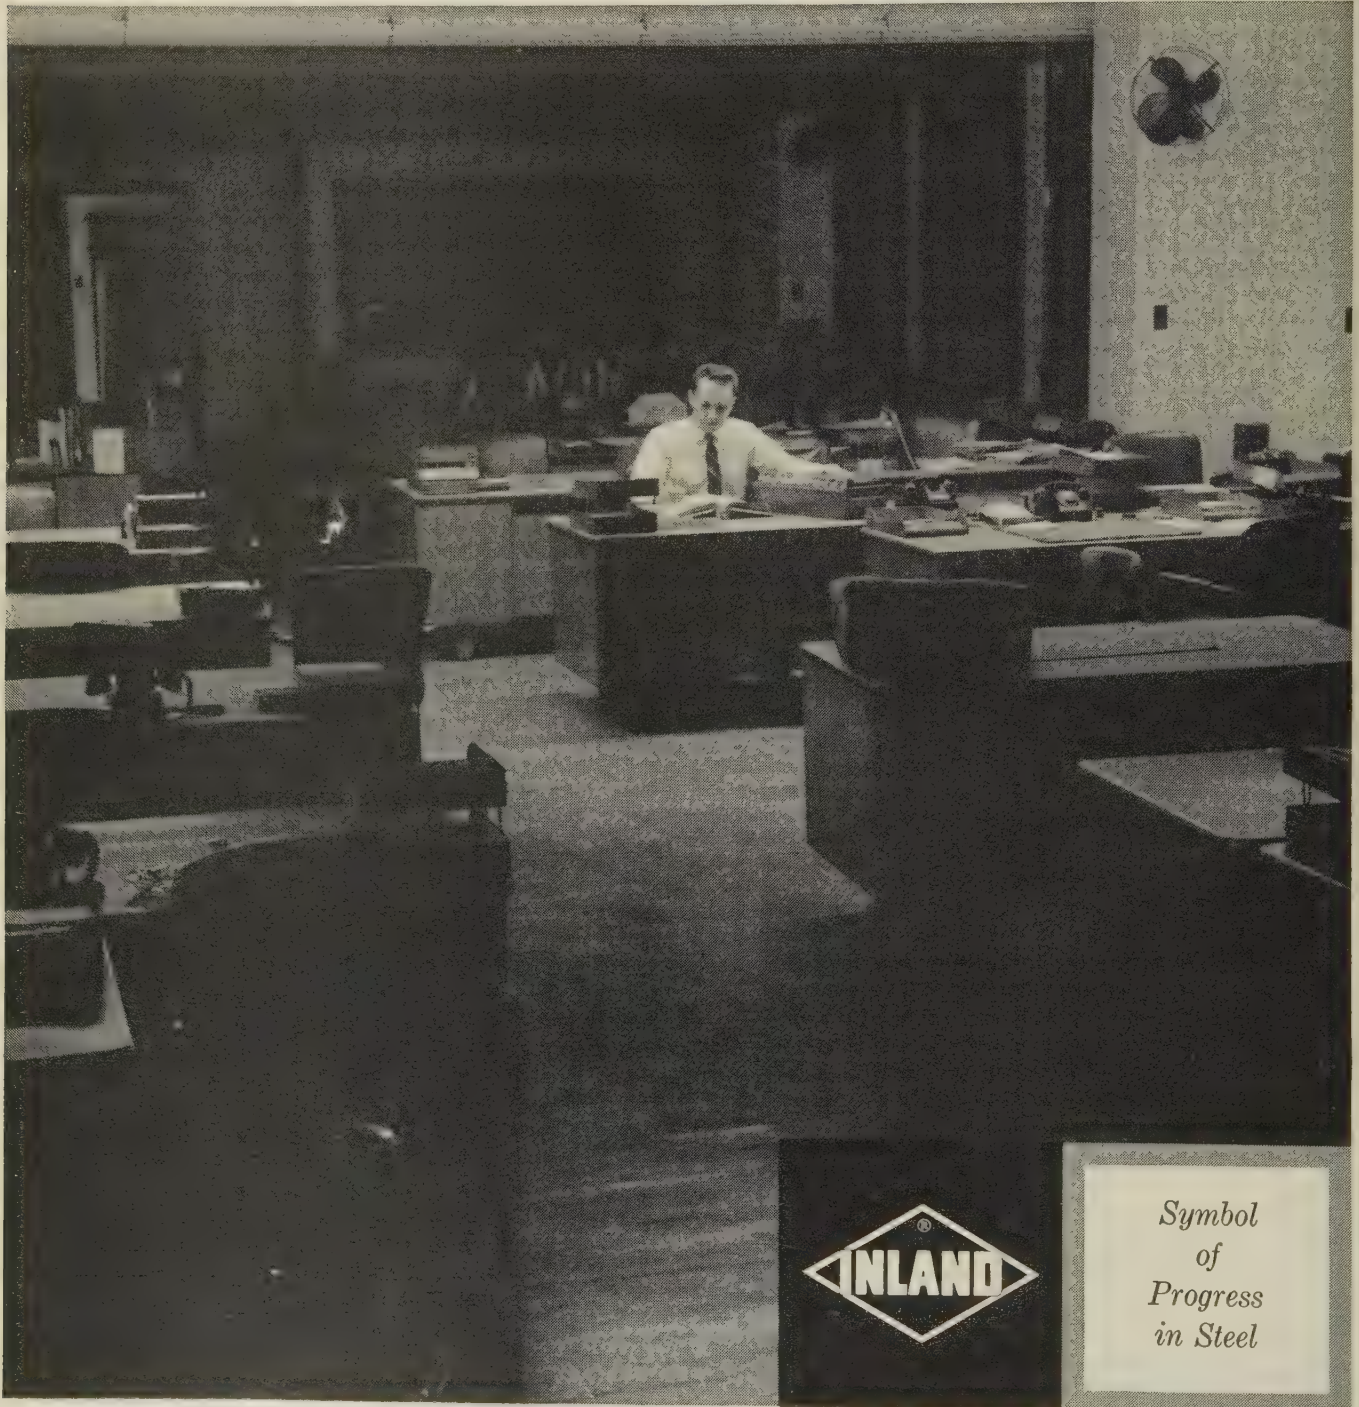

To those who have fears for the future we offer another remark attributed to Mark Twain: Of all my troubles, the worst have never happened.

Irwin H. Such

Making steel is not the only after hours operation at Inland. Scheduling production to make certain you get the *kind* of steel you need, in the *quantity* you need, and *when* you need it is another job that can't be put off until tomorrow. Production schedulers are in constant touch with every mill, aware of up-to-the-minute operating capabilities, keeping steelmakers informed of changing requirements . . . like squeezing an extra 20 tons into a mill schedule for a customer with a last minute "must." As nerve center of the sales department, Inland's order division is close to the mills and close to the customer . . . ever sensitive to his requirements.

Components Show Slow Upswing in Fourth Quarter

Timken Roller Bearing Co.

Diecastings—Automotive business is behind the fourth quarter pickup. Total tonnage in 1957 will rise, but dollar value will dip.

Electrical Equipment & Motors—Fourth quarter will be about equal to last year's corresponding period.

Fasteners—Upturn is developing slowly, but the quarter will be better than last. Strength will carry over into 1958.

Ferrous Castings—Gray iron, malleable, and steel castings are all in a downtrend. Reductions in the workweek and labor force are common.

Forgings—Poor third quarter made better fourth inevitable. Aircraft cutbacks have hurt some companies.

Gears—Fourth quarter orders are holding at about the level of the rest of the year. Present volume is "comfortable."

Nonferrous Castings—Activity has increased slightly, but reductions in the workweek and labor force are common.

Screw Machine Products—Orders and shipments are behind 1956 pace; and upturn this quarter will be too small to close the gap.

Springs—There has been no significant upturn so far despite better sales to the farm equipment and electronics industries.

Stampings—Ups and downs about evenly divided, leaving the over-all position in fourth quarter at previous level, which was good.

Wire Shapes—New orders are increasing by 10 to 15 per cent in the fourth quarter, with a continuation into 1958 a strong possibility.

Makers Mildly Optimistic

"NOW THAT business is only wonderful, a lot of people are steamed up because it isn't spectacular."

That's how one producer of electric motors views business today. The majority of component makers contacted by STEEL agree with him and see a mild upturn for partmaking in the fourth quarter. But a substantial minority are still pes-

simistic. A common point made by optimists and pessimists: "We're captives of the industries we serve; no amount of 'sell' will persuade the machine tool builder to make more tools or the automaker to assemble more cars."

Here are the common reasons for predicting an upturn or downturn:

Upturn—Many partmakers say

the third quarter was so low that the only way they have to go this period is up. For some, the upturn would have to be terrific to wipe out the losses of the preceding quarter. Most of those reporting a significant improvement are tied to the auto industry, which turns up at this time of the year regardless of ultimate sales. Others say the pattern is accounted for by renewed buying after vacation periods. Pre-Christmas production accounts for the uplift for others.

Downturn—Suppliers tied to the capital goods industries are feeling

the effects of the leveling off reported two weeks ago in STEEL (Oct. 21, Page 42). Cutbacks in the government's aircraft program are being felt particularly by the forging industry. A continuation of inventory reduction is generally slowing things up, accompanied by the wait-and-see attitude of many end-product manufacturers. Tight money has little direct effect on many suppliers, but it has slowed down some of their customers.

The industry-by-industry breakdown:

Diecastings—The auto industry has been responsible for most of the fourth quarter increase, although appliance makers have helped out. Zinc is holding its own this year, and aluminum will show a 4.9 per cent gain over the record tonnage in 1956. Brass diecasters report no upturn, but some believe this could be a near-record year. Magnesium castings will miss out on a record because of cutbacks in airplane building.

Industry dollar volume will be down because of price drops in major nonferrous metals this year. Despite rising labor costs, one foundry says it is reducing costs: A part it is making for 42 cents cost 50 cents last year.

Electrical Equipment, Motors—Orders are about the same as they were a year ago—which is good. But no definite upturn is evident. One manufacturer says: "I know organizations that are doing twice as much business today as they did two years ago, but because they had forecast they would do two and a half times as much, they are disappointed. We have been spoiled."

Fasteners—The fourth quarter is developing a little slower than expected, but autos and appliances are providing some punch. Some customers, such as the railroads, had more inventory than anticipated, but they are beginning to order again. Dollar volume this year will be a little ahead of last year's, but physical volume will fall shy by a small percentage.

Ferrous Castings—Of all the components considered in this survey, ferrous castings are probably the worst off. Orders from railroads, which account for about 40 per cent of steel foundries' busi-

ness, are dropping off as the backlog of freight cars declines. Shipments for 1957 will be off the 1956 pace by 10 to 15 per cent, but this will still be a good year. Dollar value will be about equal to last year's because of increased prices.

Gray iron foundries see no upturn in the near future. Many are working only 20 or 30 hour weeks, or are cutting their work force. The fourth quarter will probably be better than a poor third, but it will still be about 8 per cent below last year's period. An upturn should come in 1958's second half, but until then, the present level will hold.

Malleable casters talk optimistically of holding at the present level, mainly on the strength of auto orders. Any pickup expected because of this has been canceled out by reductions of 15 to 20 per cent in sales to other big customers.

Forgings—Most shops contacted report business is up in this quarter over last, but it's still not as good as it was in the first quarter. Those doing heavy business with the Air Force are hurting because of cutbacks. One Columbus, Ohio, firm says its orders have increased about 20 per cent since August, and inquiries are about 10 per cent above the year-ago level.

Gears—Gearmakers are a little disappointed with the failure of new orders to pick up in the last two months. However, the industry has not backed off from the high level it has maintained through most of 1957. Orders for special gearing continue high, but machine tool and standard gears are down.

Nonferrous Castings—Orders for permanent mold castings are equal to or better than they were a year ago, but sand casting orders are down significantly. The pattern of order placing is hand-to-mouth, with little inclination on the customer's part to commit himself far in advance.

Screw Machine Products—There has been some pickup over September business, but that month wasn't too good itself. The year so far is somewhat below 1956 in shipments and orders, and it doesn't look like the fourth quarter will change the picture. One

maker claims he expects to repeat this year's volume next year and will still consider it good.

Springs—No significant upturn is reported, but producers anticipate it will come before the end of the quarter. There has been some firmness in sales to farm implement makers and the electronics industry, while appliance makers have been holding back. The number of small orders is increasing.

Stampings—About as many manufacturers report ups as downs in this industry, although many observers feel the potential for a real upswing is still present. Nevertheless, 1957 will be a pretty good year, according to H. A. Daschner, secretary of the Pressed Metals Institute. Next year should be slightly better.

Wire Shapes—The fourth quarter rise is definitely here for this industry, and it will carry over into 1958. Producers claim that when business in general is down and the emphasis is on cost cutting, their orders usually pick up. They claim it is often cheaper to use wire shapes than sheet metal parts. Orders have picked up as much as 20 per cent for some companies in this quarter.

To Produce Press Products

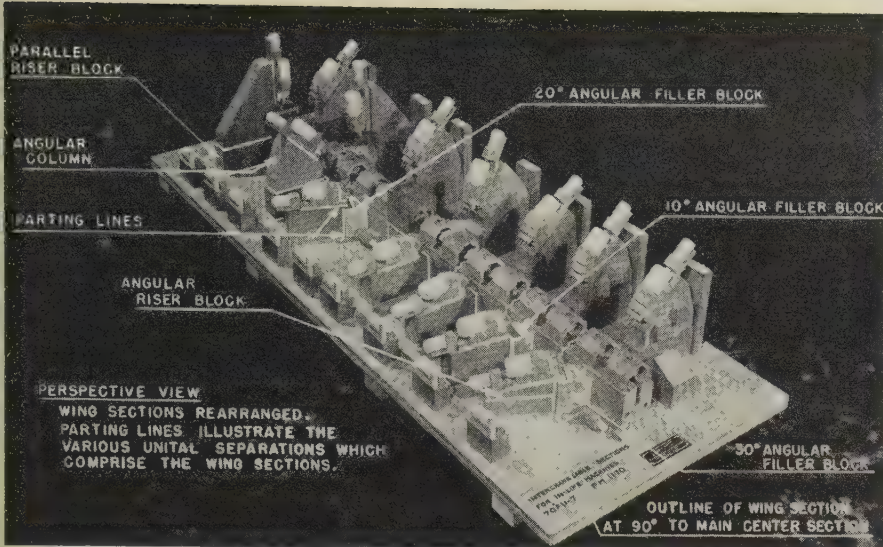

Pheoll Mfg. Co., Chicago, acquired a new plant in Michigan City, Ind., to produce press products. The 76,000 sq-ft building is on an 11½-acre tract. Noland McDonald is general manager.

Janitrol Starts Expansion

Surface Combustion Corp.'s Janitrol Aircraft Div. is spending \$2 million for new buildings in Columbus, Ohio. All Janitrol operations will be at one location. Included in the new facility will be engineering and sales departments, as well as manufacturing, purchasing, and production control.

Of the 130,000 sq ft to be added, 90,000 will be for manufacturing, 20,000 for research, development, and testing, and 20,000 for offices and training and conference rooms.

Among products to be made will be aircraft heaters, heat exchangers, pneumatic regulators and valves.

Ford Motor Co.

White lines on this model show where standardized units can be detached from the in-line transfer machine. Bases, wing sections, and columns could be rearranged to make up an entirely new machine

Standardized Tools for U.S.?

Pentagon shows interest in Ford's building block concept. It may aid quick mobilization or production of missiles. Machine tool industry will be checked for opinions

WASHINGTON'S machine tool buyers and planners are taking a long look at high production equipment.

Most of those men recently sat behind closed doors in the Pentagon and heard representatives of Ford Motor Co. spell out their building block concept for machine versatility.

Why the Interest?—First, mass-production machines that can be quickly built up from standard components (Ford's plan) may cut the time it takes to start up defense production. Second, if the first stages of war knock out substantial parts of our production, we might be able to get on our feet fastest if could rebuild critical facilities with equipment and components that were spared.

A third possible reason is still speculative. The Air Force, a prime mover in these discussions, could be thinking in terms of current production for guided missiles.

Caution — Defense Department spokesmen say that no decisions will be made on Ford's concept until they find what machine tool builders think about it. STEEL has sampled that opinion (see Page 68).

The two men who did the talking for Ford at the Pentagon were D. C. Pippel, manager, mobilization planning and defense sales department, and H. C. Daum, manager, machining process department, manufacturing engineering office.

Impact—Mr. Pippel told what he thought the building block type of equipment could mean to defense when he said: "This concept is the most important innovation in the metalworking industries since the early developments in automation. I believe it could make obsolete all existing estimates of the nature and magnitude of America's potential for the production of defense materiel in an emergency."

Program—Mr. Pippel suggested the government could: Make precise plans for products needed on M-Day, adopt the building block concept for production of these products, design machine tool components needed for the job, build and stockpile these components.

Then, he explained, if war comes, the defense manufacturer: "Will be able to quickly convert his own tools and equipment to military production. And he will be able to draw on the government's stockpile of standard components and assemble the additional machines he needs."

Summary — Mr. Pippel rounded out his presentation with these words: "Recent estimates indicate that if a successful mass nuclear attack were made on this country by a ruthless enemy, casualties could reach fantastic totals.

"If such a conflict were to come about, the nation that is first able to stagger to its feet, rally its remaining resources, and put together some semblance of a production system will probably emerge victorious.

"And remember, that the key to the prompt restoration of production, so essential to our survival, may well be the concept which I have been exploring with you here today."

What Is It? — Mr. Pippel explains the building block concept as: "The application of standardization to the design and construction of automatic machine tools by incorporating interchangeable components into the structure of these machines."

Mr. Daum elaborates: "In in-line transfer machines built to this concept, matching surfaces for such major components as vertical and angular columns, wing bases, and main bases would be standardized dimensionally. Appropriate dimensional standards would be developed for each of the various horsepower ranges of drive units normally encountered."

Here are the dimensions Mr. Daum says are susceptible to standardization: Work height from the floor to the loading surfaces of the fixture, standard mounting patterns for bases and for machine components like vertical columns and power unit adapters.

Underway—As Mr. Daum point-

Builders Look at Building Blocks

WHEN government goes to industry for an opinion of the building-block concept, there'll be no fast endorsement or condemnation. Most builders see it as a relatively simple proposal with highly complex ramifications.

To sample industry thinking on this subject, STEEL talked with many builders. This report is based on their answers.

Yes and No—Many builders, notably those who have sold machines to Ford's new specifications, have no quarrel with standardization by the user. They see it as a good way to get standardization within a company and they understand the desire for the interchangeability. Such thinking presumably applies to the government writing its own specifications.

There is some objection when it's suggested that users (or worse, builders) get together to write a single standard for all to follow. In addition to the tough task of getting everyone to agree on one set of specifications, general standardization would infringe on the industry's brand of free enterprise.

Price is not the prime source of competition in machine tools. It's competition involving the ingenious machine design, technical feature, and production concept. Such competition has led to most of our production advances. Anything that smacks of standardized machine tool design will meet opposition. Some feel that any such a deterrent to new and better product development would limit their ability to sell in the replacement market, and that's their big target.

(Ford answers this way: "We're only talking about mounting dimensions, not component design.")

A few builders pointed out that, once started, the trend toward standardized machine components may be hard to stop. At the far end of the trend they see a possible environment in which a user can purchase standard components from any of a dozen competing builders and then assemble the machine himself. Builders would no longer serve as designers and innovators but would become suppliers of production line hardware. That's a role they don't want.

Here are two other questions that may be asked when the industry is queried: 1. What about the legality of builders getting together to agree on product features? 2. If government specifications are written, who will pay for re-design, new patterns, molds, jigs, fixtures, and other modifications needed to conform to the new specifications?

ed out in Washington, the idea is not new. Some machine tool builders already use the principle in their own products. "However, each company has its own standards. There is no intercompany interchangeability."

Obsolescence—Ford has aimed the concept at what Mr. Pippel

calls ruinous recurring tooling costs. He cites a case in point: "Six years ago Ford's No. 1 engine plant in Cleveland was a production man's dream. But it had one serious defect—it was a monolithic monster — admirably adapted to the job for which it was designed but completely in-

flexible." Recent design changes in engines obsoleted the equipment, and much of it had to be dismantled and carted out the door.

He asserts: "We've got to stop building single-purpose production lines. We've got to make our machine tools flexible enough to accommodate the changes in product design which we must expect in this business every two or three years from now on."

Ford's answer is a sheet detailing "General Specifications for Interchangeable Components of Automatic In-Line Transfer Machines." All potential suppliers of new transfer machines are required to conform to these specifications. All in-line machines at the new Lima, Ohio, engine plant, for example, meet these requirements.

Two To Go—Mr. Daum told his Washington audience that the program is not complete. It will be necessary, he feels, for users and machine tool builders to co-operate in arriving at "industry-wide dimensional standards for mounting patterns of the major components required to construct nearly all production machine tools."

Next would come standardization of physical dimensions for spindle heights and mounting dimensions of manufacturer's power units. Ford already has suggested that a Joint Industry Conference be set up to consider problems that would have to be solved if the program is to succeed.

Plans Big Powdered Parts

Chicago Powdered Metal Products Co., Schiller Park, Ill., will install molding presses (up to 300 tons) in the plant addition it is building. They will accommodate parts up to 15 in. in diameter. Cost of expansion: About \$150,000. Completion date: Jan. 1, 1958.

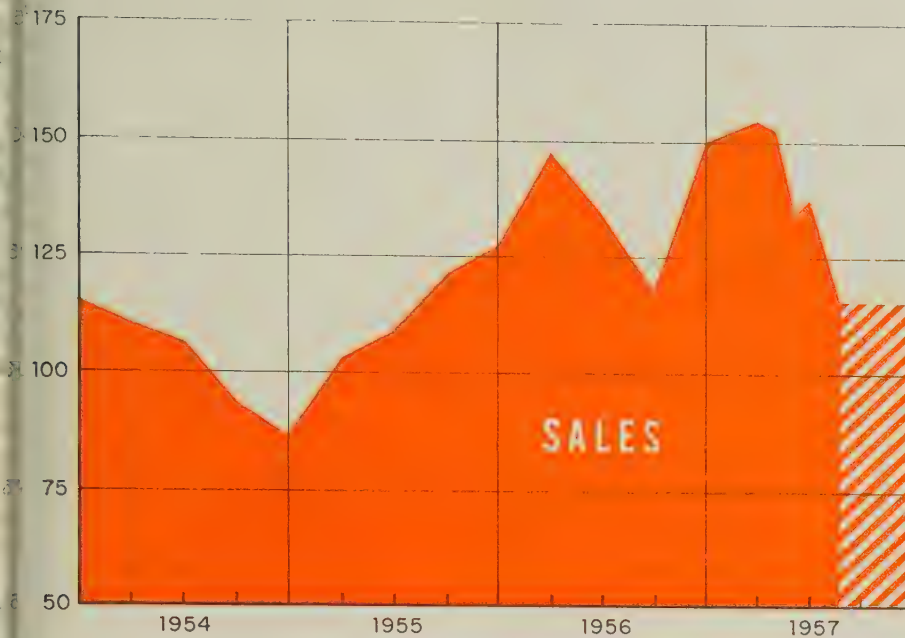

Builds Aluminum Plant

Capitol Products Corp., Mechanicsburg, Pa., will build a 70,000 sq ft aluminum fabrication plant near Sherman, Tex. It's scheduled to open in February, 1958.

The one-floor facility will serve a ten-state area. It will employ about 200.

Used Machine Tool Sales Level Off

(Index: 1947-49 = 100)

Source: Machinery Dealers National Association.
Last four months estimated by STEEL.

Used Machine Tools Slow

Potential market is large, but users' caution is a deterrent. Dealers' views vary, but most believe high rate of inquiries means pickup by second quarter of 1958

"WE have demonstrated used machines to interested inspecting parties, but in quite a few cases, the sale has not been made," says W. L. Thomas, president, Price-Thomas Inc., Cleveland. Many used machinery dealers are in the same boat.

Inspections and inquiries are high, but as Mr. Thomas puts it: "There seems to be a great deal of hesitancy on the part of management, a keynote of caution, due, no doubt, to the general feeling at this particular time. Let's face it—things are slow.

"We see no cause for serious alarm. We have had the usual amount of inspections, and many should materialize in 30-60 days."

Support—R. K. Vinson, executive director, Machinery Dealers National Association, Washington, feels the same way:

"Individual dealers' opinions range from bad to extremely good," says Mr. Vinson. "It is my opinion that sales for September and October will be better than August's, the usual low point in used machine tool sales."

Other Views—"Inventories (of used tools in dealers' hands), generally speaking, are high," says E. A. Golan, MacDell Corp., Chicago. "The position allows you to offer a greater range and selection of machinery to your customers.

"There is a reduction in sales and inquiries, compared with what they were last spring and in the winter of 1956-57. However, we are still getting inquiries and making sales. We look for this modest picture to continue for several months, with an increased volume by the second quarter of 1958."

Says J. T. Weiss, president, In-

terstate Machinery Co. Inc., Chicago:

"There have been signs in the last few weeks of far more activity on the part of manufacturers in the market for used machine tools. Based on this, it is our feeling that the fourth quarter and the first quarter of 1958 should show a reasonably good upturn."

From the East—Richard M. Nathans, Kings County Machinery Exchange, Brooklyn, N. Y.:

"There is an improvement in used machinery sales over the mid-summer lull. Heavy fabricating shops, structural and plate, are buying more presses, punching equipment, brakes, power presses, and bending rolls. Sales are not closed as readily as formerly, and users are more sensitive to price, but second half improvement over the second quarter is apparent."

R. Douglas Williams, Williams Machinery Co., Newark, N. J.:

"The sales curve for used machine tools usually follows the trend in orders for new tools, with a 30 to 45 day lag. Machine tool builders' bookings have declined most months for more than a year. As a result, a pronounced rise in used machinery sales cannot be anticipated."

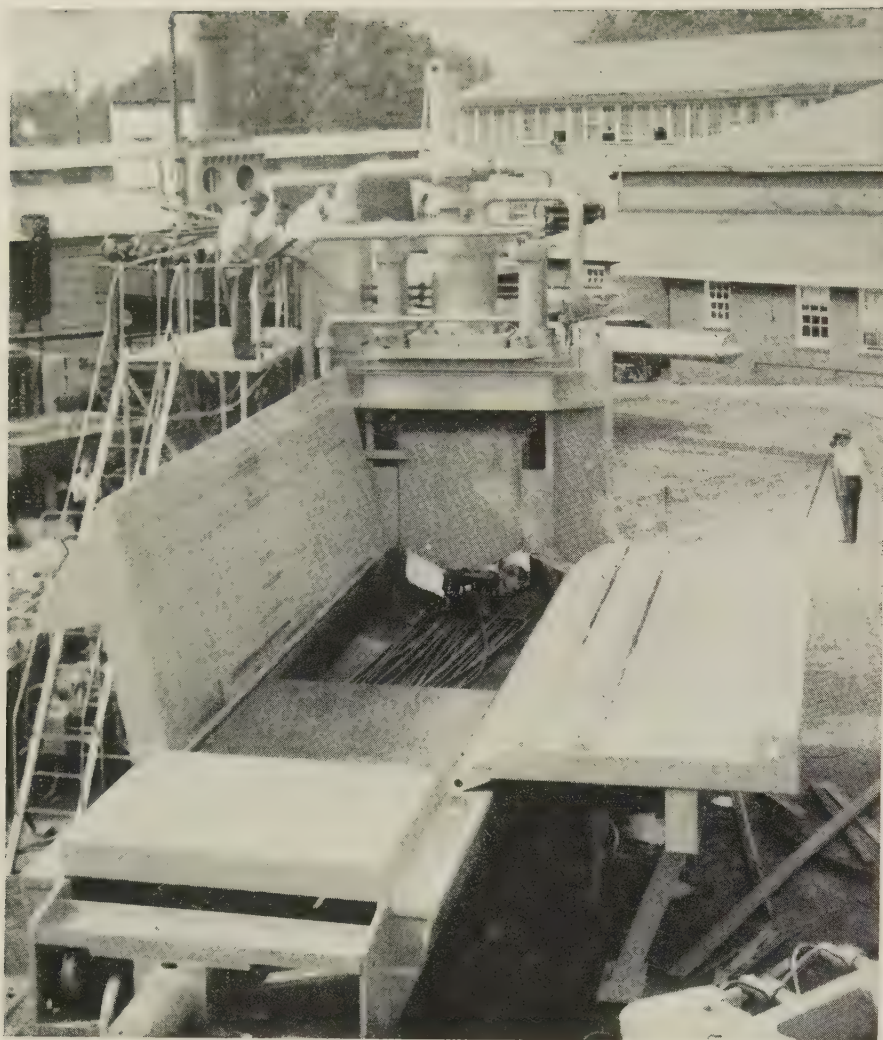

Bearing Maker Adds Plant

Split Ballbearing Div., Miniature Precision Bearings Inc., will build a 30,000 sq-ft plant at Lebanon, N. H., at a cost of \$350,000. It will triple present floor space. The workforce of 75 will be doubled when the new facility is completed in the spring of '58. The present plant will be leased or sold next summer.

Rockwell Plans Realized

Rockwell Mfg. Co., Pittsburgh, has completed the expansion of its western Pennsylvania plants. More than 50,000 sq ft of manufacturing area, plus a new gas meter laboratory, have been added to the Du-Bois, Pa., plant. About 27,000 sq ft, including new engineering facilities, were added to the Uniontown, Pa., water meter plant.

At its Murrysburg Laboratory, Rockwell is increasing testing capacity from 2000 to 7000 gallons per minute.

Harris Foundry & Machine Co.

This new hydraulic machine is designed to . . .

Shear Scrap, Cut Costs

"YOU'LL slash scrap-cutting costs 70 per cent!"

The promise is made to scrapyards and steel plants by a company which has introduced a new production model of a hydraulic scrap shear.

The maker, Harris Foundry & Machine Co., unveiled and demonstrated the king-size, highly mechanized shear before several hundred representatives of the scrap and steel industries at its Cordele, Ga., plant.

Test—A pilot model of the shear

reduced scrap cutting costs to \$1.50 a ton at the yard of Calumet Iron & Supply Co., East Chicago, Ind. (Over a ten-month trial, the average daily handling was 100 tons.) While costs will vary in different parts of the country, Harris believes the maximum per ton anywhere will not exceed \$2, including depreciation on the machine, maintenance, and operation costs. Cost of preparing scrap with a conventional cutting torch and hand fed shear crew is \$6 to \$10 a ton, it says.

Two-Way Saving — The shear does two things: It reduces the number of men needed, and it increases output. Two or three men can do the job—one man to operate the shear, one man to operate a crane, and preferably one man to watch for objectionable materials. Work can proceed in almost any weather.

The Harris S-501 hydraulic scrap shear cuts up to a 5-in. round of steel or a 1-in. mild steel plate up to 5 ft wide.

What It Can Do—In 8 hours, the shear can cut: 100 tons of miscellaneous junk shop scrap, or 120 tons of miscellaneous farm scrap, or 150 tons of miscellaneous industrial scrap, or 200 tons of uniform plate scrap.

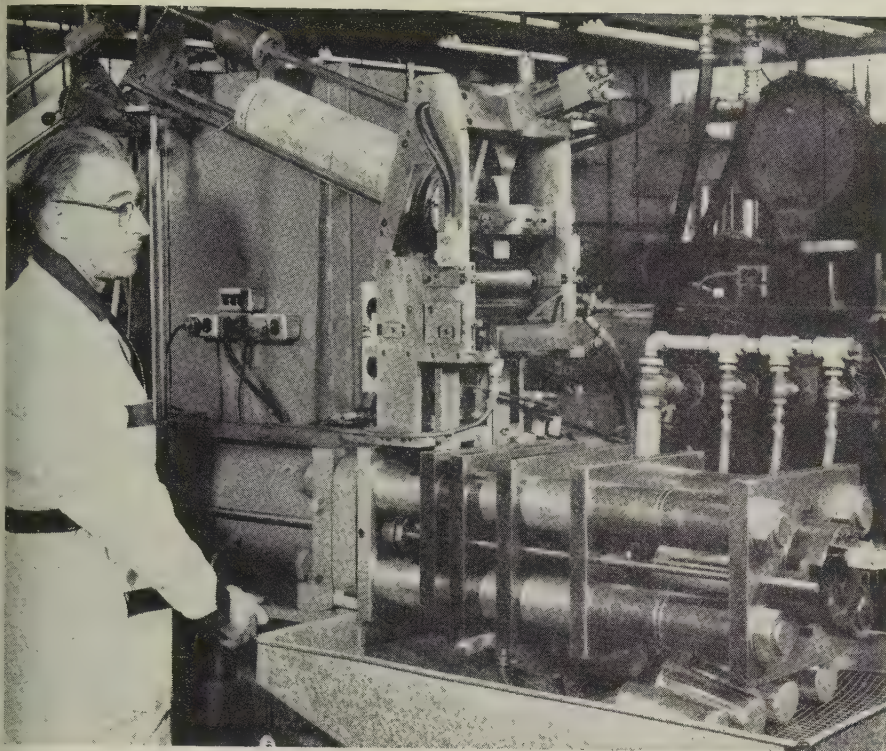

The shear, which can exert 500 tons of force, has an opening 30 in. high and 60 in. wide.

How It Works—From a charging box 264 in. long, 80 in. wide, and 30 in. high, scrap is fed to the shear. Charging can be done while the knife is shearing. Because the machine has a cover which exerts 78 tons of force, the charging box can take a tank up to 4 ft in diameter made of material $\frac{3}{8}$ in. thick. The cover smashes the tank, and the charging box ram, which operates with 50 tons of force, pushes the material under the blade.

The S-501 is equipped with automatic controls for continuous operation. Selling for \$145,000 f.o.b. Cordele, Ga., it weighs 241,000 lb.

Giants—Scrap balers demonstrated by Harris offer further evidence of the trend toward king-size scrapyards equipment. Its second largest machine crushes an auto body into a bale in 1 minute and 35 seconds, weighs 390,000 lb, and sells for \$225,000 f.o.b. Cordele. Its largest baler (it takes two auto bodies at a time) sells for \$335,000.

Because of its sizable backlog for presses and shears, Harris is quoting delivery in eight to ten months, but it hopes to do better than that on shears through an arrangement with two other companies to build them. Harris hopes to manufacture three to four shears a month in 1958 and provide delivery in four to six months.

This equipment that can deep draw aluminum is big gun as...

Kaiser Aims at Can Market

A NEW DEEP DRAWING technique has put aluminum in a position to make a bigger bid for the can and container business.

Developed by Kaiser Aluminum & Chemical Corp., the process incorporates several dies in a single-stroke press operation to produce a container with a depth up to three times its diameter. Conventional methods limit depth to 50-60 per cent of diameter in a single draw.

Aiming at Cans—Kaiser's first target: Can manufacturers. "This development, along with present use of aluminum by canmakers, may well provide a new major market—challenging even the building market," predicts D. A. Rhoades, vice president and general manager. "Only 10 per cent of the present can market adds up to 200,000 tons of aluminum," he says.

The picture above shows the

process in operation. Circular blanks are fed from the top. The hydraulic-actuated punch forces the disc through cupping, ironing, and bottoming dies in a single stroke. The seamless can emerges highly polished and requires only degreasing, trimming, and flanging. Another drawing punch operates simultaneously from the other end of the press.

Output Begun—Kaiser has installed a prototype of a commercial facility at its Wanatah, Ind., container plant and has started production on an order for 5.5 million cans from Kraft Foods Div. of National Dairy Products Corp.

Officials are waiting for operating results before revealing production speeds. They admit: "It's faster than conventional drawing but certainly not up to the 500-per-minute speeds of conventional lines that make tin plate cans. Investment in the aluminum line,

however, is considerably less than the tin plate facility."

New Markets Opening — The technique opens a big potential market in the general container industry now primarily served by spinning, impact extrusion, and conventional drawing. The seamless can is easily adaptable to special shapes through additional forming operations.

One example is a new "pop" can being used by Air Reduction Co. to package its stainless steel welding electrodes. It's a two-piece container, with the top section's rim slightly flared to form a friction fit. A waterproof, airtight, industrial tape provides a hermetic seal.

Kaiser has also developed a new die which blanks, trims, sizes, and flanges shallow-draw containers in one stroke on a single-action, vertical press.

Expansion Progresses

U. S. Steel Corp.'s Youngstown District Works has put its new iron ore handling facilities into full operation.

Facilities in this third step of the company's blast furnace improvement program include a rotary car dumper and a series of rubber belt conveyors. The dumper unloads incoming ore in half the time previously required. Cars are emptied into a 3500-ton capacity steel hopper bin. A series of belt conveyors moves the ore at the rate of 3000 tons an hour to the 1.5 million-ton ore storage yard.

Form Two Companies

Jomac Inc., Philadelphia, and James North & Sons Ltd., London, England, have established two new companies to manufacture and sell each other's products. Jomac makes terry cloth work gloves; James North, work gloves and protective clothing. Jomac-North Inc. will install manufacturing equipment in Jomac's plants in Philadelphia and Warsaw, Ind. North-Jomac Ltd. will operate in North's two factories in Hyde, Cheshire, England.

H. Howard Colehower is president of both Jomac Inc. and Jomac-North Inc.

Coming: Another Look At Basic Research

NEW LEADERSHIP in basic research may soon come from the federal government. The National Science Foundation, the scientist's best critic in this country, has come out with recommendations which Congress will probably endorse next year.

NSF's director, Dr. Alan T. Waterman, has presented President Eisenhower with several hard-hitting ideas on how to promote basic research. It is expected that the President will transmit the ideas to Congress in January.

Dr. Waterman's main points: 1. Industry must give more money to universities and nonprofit groups for basic research. 2. Management must give scientists a free hand. 3. Uncle Sam should encourage industrial trade associations and professional societies to support basic research. 4. The federal government should match state funds for basic research in state schools. 5. Tax laws should be changed to encourage gifts for basic research. 6. Government agencies should cut applied research and increase basic research. 7. Federal grants should carry a minimum of restrictions on the direction basic research should take.

Before It's Too Late

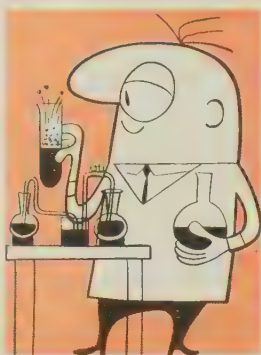

In some senses, Dr. Waterman's report to Ike is an ultimatum: We must change our ways before it is too late. He is particularly concerned about two aspects of research in this country: 1. We don't spend enough money. 2. We don't spend it in the right places.

This year we'll spend about \$500 million on basic research. All research (including applied and development work) costs the nation about \$7 billion. It is noteworthy that the Air Force's "Operation Farside," which sent a rocket 4000 miles into space, cost only \$750,000, and there were top men in the Pentagon who wanted to cut that off.

Dr. Waterman agrees that the U. S. spends more than any other country in the world on basic research, yet, he adds, our potential is tremendously greater than the \$500 million allows us. NSF grants money for basic research to only about one-third of its applicants. Its fiscal 1958 budget is \$40 million, but only \$22 million goes directly into research.

The Russians may use as many as one-third more scientists in basic research than the U. S.

From whatever source more money comes, Dr. Waterman thinks most of it should be placed in the hands of the universities, the "traditional" place for such work to be done.

Answer: Cabinet Level for Science

On Capitol Hill, sputnik has Congress thinking about the need for a cabinet level science post. Sen. Estes Kefauver (D., Tenn.) is one of many favoring the idea.

We need a man, says Senator Kefauver, "to gather all the bits and pieces of research and development that are being done throughout the government" to create "one, hard hitting, co-ordinated program."

Citing the case of Dr. Robert Oppenheimer, Senator Kefauver also wants a new look at our security regulations, which he terms "antiquated."

New Hope for Continuous Casting?

R. Easton, manager of the continuous casting section, Koppers Co., told Sen. Estes Kefauver's (D., Tenn.) subcommittee: 1. He "hopes" that, within one year, a major steelmaker will order a continuous casting machine capable of making slabs from 200 ton capacity, open hearth furnaces. 2. Within three years, the machine will be in commercial production. 3. After proving itself, continuous casting will become widely used in new facilities. Mr. Easton did not make a case for replacing facilities with the process. While generally satisfied with U. S. steelmaking research, he noted that Russia expects to continuously cast 20 per cent of its steel by 1960.

Much Progress in Europe

Senator Kefauver reported the State Department as saying: 1. Russia probably has one plant capable of producing 200,000 tons of continuously cast steel a year. 2. At least nine research centers and steel plants in Russia have been using the process—one since 1949. 3. Half the production built by Russia in its five-year plan ending in 1960 will use the method. 4. Over 30 installations throughout the world use the process; 13 are industrial enterprises (though perhaps they're not up to U. S. commercial standards).

Meet Arvid O. Lundell: He's the new adviser to Andy Olsen, director of the metal-working equipment division, Business & Defense Services Administration. Mr. Lundell is president of Colonial Broach & Machine Co., Detroit. He will be in Washington for about six months, where he may be reached at the Commerce Department: Phone STerling 3-9200. Extension 3526.

For a 65-year-old valvemaker . . .

Rejuvenation Pays Off

LIFE BEGINS at 65 for Golden Anderson Valve Specialty Co. Inc., Pittsburgh. Awareness of the company's potential, reflected in a new marketing philosophy, brought about the rejuvenation.

Founded in 1892, the firm settled into a life of middle-aged respectability following the death of its former owner in 1934. "Everybody knows we make valves, so wait for the orders to come in," could have been the company's sales slogan in the early 1950s.

Middle-Aged Laxity—Grant A. Colton, chairman and president, explains: "Our former owner left the company in trust, controlled by a Pittsburgh bank which hired a manager. Restricted in our expansion and under 'absentee management,' we didn't move out of our orbit.

"We made the same valves with limited applications for many years. The bulk of our sales went to municipal waterworks. Although our valves served successfully, we weren't known generally as an industrial valve supplier. Manage-

ment had no plans for developing broad industrial markets."

Rebirth—That middle-aged feeling ended and facelifting began in December, 1956, when Mr. Colton, John H. Kilmer Jr., executive vice president, and Paul B. Brauer, in charge of production, acquired all outstanding stock.

"We had two choices: Sell principally to municipalities for a steady sales plateau, or enter the tough and competitive, but rewarding, field of industrial sales. We took the hard road, which led to sharply increased sales in the atomic, pulp and paper, and chemical processing industries," Mr. Colton says. "Steel industry sales are rising, with applications in hot strip lines, on hydraulic rams, and in quenching of coke, pig molds, and ingots. Automated steel mills provide added uses."

Growth—In less than a year, the new management doubled productive capacity and office space, increased basic valve designs from 10 to 15, and added a research center in Pittsburgh. The switch

in the company's sales target makes the added capacity essential.

"Focusing our sights on the industrial market, we're designing new valves to broaden our product base," Mr. Colton explains. "For the first time, we're selling valves for specific applications, instead of simply distributing them."

Promotion — Product literature aimed directly at the purchaser helps Golden Anderson reach the industrial buyer. Mr. Colton adds: "Once our printed material was highly technical and difficult to read. It described all the valves but didn't give much information about where they could be used. The potential customer had to decide how he could fit them into his operations. If he had the time and patience to do this, we had a good chance to get his order.

"Now we are streamlining our product information. We diagram the operation of each valve. The potential user can quickly see its application. Then he can get technical details from us."

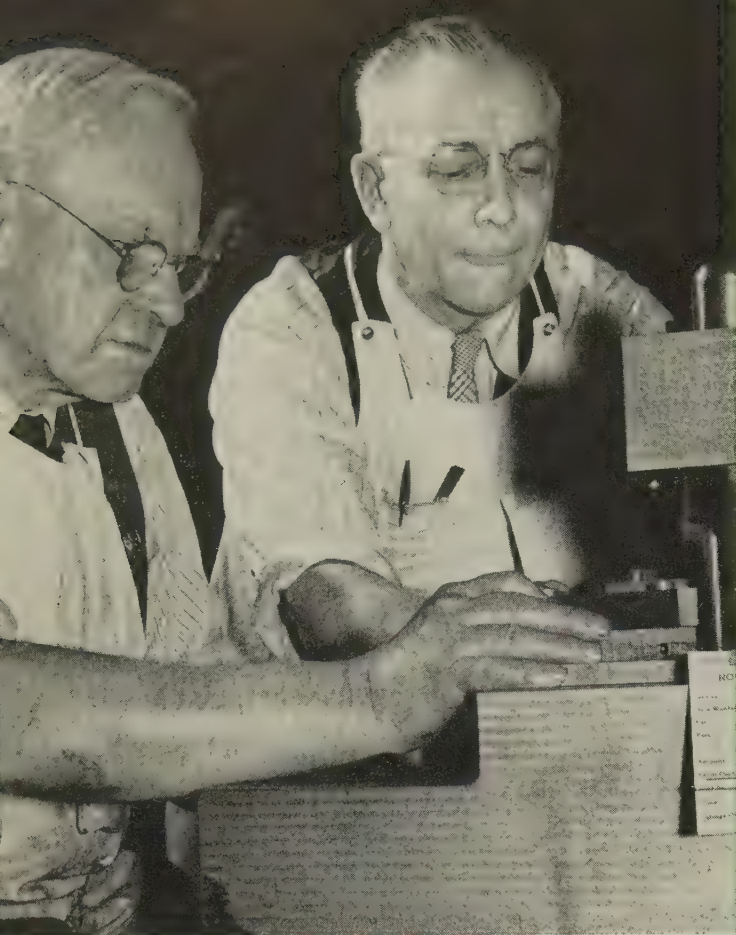

Ripe Old Age—"If inquiries indicate coming demand, 1958 will be another peak year," the firm's president predicts. Thanks to its new markets, the management group will pass its freshman test with record sales—they'll be at least 15 per cent above the best of 64 previous years. Industrial sales are surpassing those to municipalities. Mr. Colton expects the trends to continue in 1958.

Armco Boosts Pipe Output

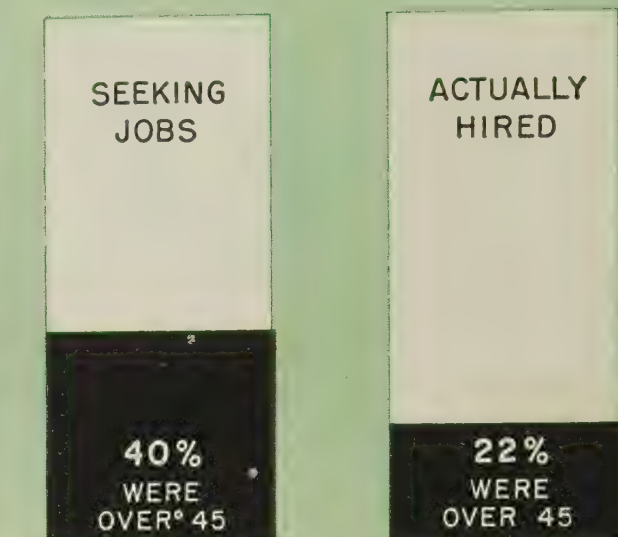

Armco Steel Corp., Middletown, Ohio, will spend \$1.5 million to boost spiral-welded pipe production by 2000 tons a month (see STEEL, Oct. 21, p. 32).

A 57,600 sq-ft building will be added to the firm's No. 2 fabricating plant in Middletown. Two pipe machines will be moved from another plant and a 25-ton overhead crane, a water tester, an end-facing machine, and generators will be purchased. Double-switching railroad trackage, water and power lines, and roads will be built.

The new facility will produce pipe in 8 to 36 in. diameters and lengths up to 90 ft.

OLDSTERS: Job Prospects Shaky

Source: U. S. Department of Labor's area study of Seattle, Los Angeles, Miami, Fla., Worcester, Mass., Minneapolis-St. Paul, Philadelphia and Detroit.

Help Wanted: 10 Million More Jobs by '65

SOME 38 per cent of the U. S. labor force is 45 and older. The proportion will rise rapidly in the next decade, but much of industry, including metalworking, shies away from hiring workers in their mid-40s.

By 1965, says the Department of Labor, 10 million more workers will be needed to achieve a gross national product of \$560 billion to meet the demands of 193 million people. Projected shifts in the age content of the population (STEEL, June 3, p. 62) show that the 25-45 group will shrink by 2 million in the next seven years, while the 20-65 group will increase by 7 million.

Age Barrier—Of the 10 million additional workers industry will need by 1965, half will come from the natural increase in the working population. Industry can get the rest by digging into the older age brackets. But it won't if present hiring practices continue.

Few, if any, companies have an official limit on age in their hiring policies. Many point out that where special skills are involved age is no consideration. But the fact remains that the average worker in his 40s has more trouble finding a job than someone younger with comparable abilities.

Reasons—"Our hiring practices are strongly influenced by our policy of promotion from within," says a steel producer. "In addition, a company which tries to do a conscientious job of organization planning for the most efficient use of manpower has its own people aging steadily.

"In this situation, the hiring of older people would shift the organization out of balance and load it more heavily on the older side."

Says another: "A major deterrent to hiring people over 45 in the steel industry is the fact that they become eligible for a non-

contributory pension after relatively few working years."

Controversy — Many organizations are conducting campaigns attempting to convince industry that it is losing valuable skills by not hiring older workers.

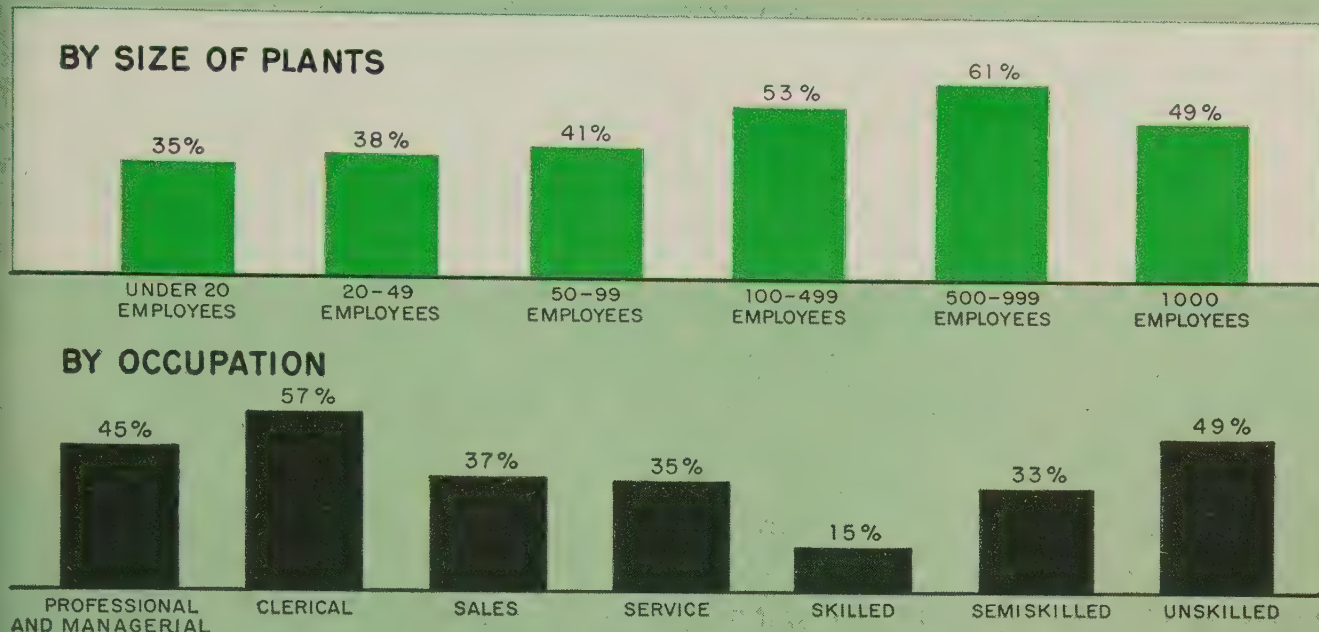

National Sales Executives Inc. reported early this year that 72 per cent of its members would not hire salesmen over 45 (STEEL, Feb. 25, p. 65).

The report terms the situation "incongruous." It warns that business and industry are wasting manpower by refusing to consider older, experienced people.

The Small Business Administration concluded from a recent survey of older workers: 1. Their absentee rate is lower. 2. They have lower injury rates. 3. Productivity does not drop as the employee ages. 4. There is less labor turnover among older people.

Federal Law?—There is interest in Congress in attaching riders to

JOB OFFERS...Restricted to 'Under 45'

appropriation bills that would bar a firm from government contracts if its hiring were limited by age requirements.

Pro, Con Examples —A Department of Labor survey last year tends to show that hiring practices cannot be successfully controlled by law.

Massachusetts has a law which prohibits age discrimination in hiring. In Worcester, for example, a check showed that 53 per cent of those seeking jobs through the state employment service were 45 and over. Of requests from firms seeking employees, 39 per cent had age limits and only 21 per cent of those hired were 45 and over.

In Los Angeles, where a vigorous campaign has been conducted to persuade employers to hire older people, 33 per cent of those seeking jobs were 45 or over. Only 32 per cent of employer requests had age stipulations, and 24 per cent of those hired were in the upper age bracket.

Age an Asset—"We hire both men and women over 50," says Warner Seely, vice president,

Warner & Swasey Co., Cleveland. "If we feel a person is qualified for a job that is open, we do not bar him because of age.

"Our experience bears out the claims of the SBA."

Says Stacy R. Black, staff director, executive department, Thompson Products Inc., Cleveland: "For as long as I can recall, we have had a policy of employing people on merit, irrespective of age. But we feel that the successor to a department head ideally ought to be 10 years younger."

Cost—The Department of Labor says that its research into comparative costs (pension and insurance) of hiring shows that the outlay for a man of 55 is about a penny an hour more than it is for a man of 30. It reports that the slight advantage in favor of the younger man is erased when you take his longer working life (and pension cost) into account.

Long Term Solution—"It is a matter of education and the condition of skilled labor supply," says Harrison H. Flick, Ohio State Employment Service, Cleveland.

"When companies cannot get younger men, they will take those who are older," he says. "But it is a long, hard wait for a man 45 or 50 who is trying to support a family on unemployment compensation."

Expensive Age—For the fiscal year ended June 30, social security accountants were alarmed to learn that benefits paid out during that 12 months exceeded income from the payroll tax by \$125 million. For the same period, \$5.3 billion was paid out in benefits, a figure expected to triple by 1975. The payroll tax is not likely to increase that much.

Rising costs of social security and unemployment benefits can be met largely from only one source: Taxes. As the clamor increases over inability of persons over 45 to get jobs, social security age levels may be lowered.

Management's Choice—Industry must decide—and soon—whether it is best, morally and economically, to provide gainful employment for older people, or to pay more in taxes for their support.

WHEELABRATOR[®] SUPER TUMBLAST

*Saves
labor*

*Saves
maintenance*

*Saves
time*

Super Savings for Pacific-Southern Foundries, Inc.

Labor requirements slashed three men daily! Cleaning time drastically reduced! Cleaning department geared to production requirements! These are some of the super savings Pacific-Southern Foundries, Inc., Bakersfield, California, obtained with the installation of a 28 cu. ft. Wheelabrator Super Tumbler for cleaning cast steel high-pressure valve bodies and parts.

Cleaning approximately 70 tons of steel castings per day, the Super Tumbler handles the bulk of all cleaning—about 60%—faster, more efficiently

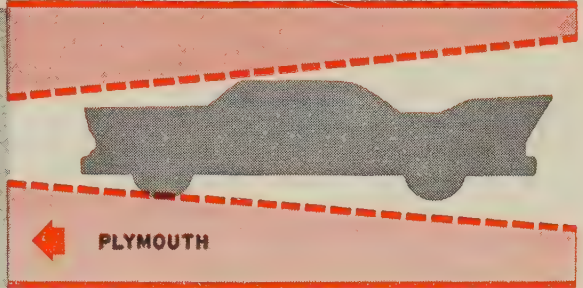

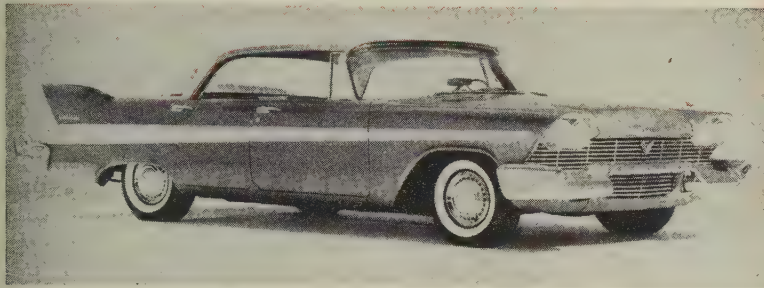

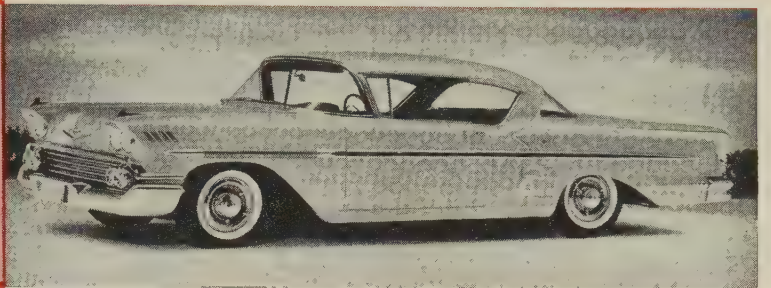

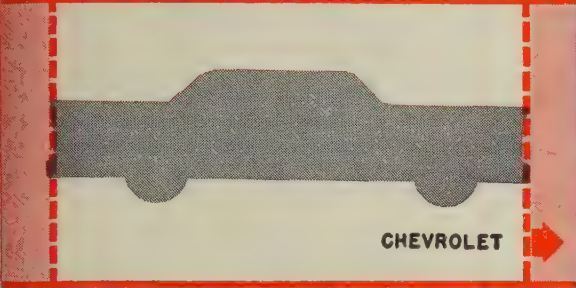

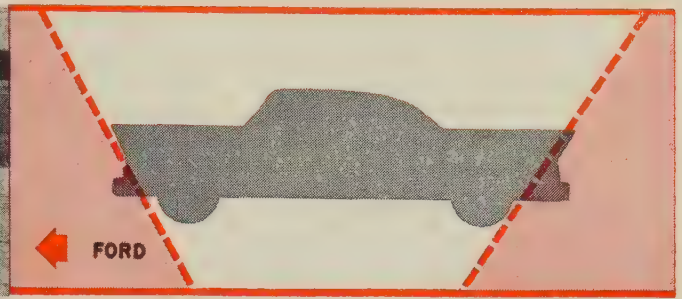

and at less cost than by previous methods. Castings cleaned range in weight up to 800 lbs. Typical loads weigh approximately 3000 pounds. In eight months time — 1618 wheel hours — maintenance required has been even lower than expected!

This super-performance is typical of that obtained by all kinds of foundries with the Super Tumbler. Available in three sizes, the Super Tumbler can make similar savings for you. Write today for complete information.

Styling Trends Jell

AS 1958 CARS appear, it's increasingly evident that styling trends developed in the last few years won't be radically changed through 1960.

It doesn't mean there won't be refinements in appearance, or modifications in designs.

Settled—But it's obvious GM's box shape, Ford's sculptured steel designs, and Chrysler's flying wedge are the patterns car designers have settled on for the rest of the 1950s.

George Walker, Ford's vice president of styling, puts it this way: "The industry will gradually settle down and improve on present styling trends."

Limits—In '56 and '57, models were made to look drastically different by lowering heights 3 to 5 in., but the human body can only be squashed so much.

Roy A. Brown, chief stylist for Ford's Edsel Div., says: "The trend toward lowering automobiles probably can still be pursued although ultimately a point will be reached where further decreases will no longer be attainable."

With present body shells, the height limit seems to be about 52 to 54 in. So from the styling standpoint, basic bodies probably won't be changed much. Appearances will be modified with sheet metal changes and trim designs.

Ford—Mr. Walker calls it improvement instead of refinement. He indicates that in the next few years Ford will emphasize interior trim.

"More changes can be expected in the glass area, which will give airiness to the cars," says Mr. Walker. Cockpits instead of seats may appear. Instruments, instrument panels, and steering wheels will be readapted, he adds.

Chrysler—When the "Forward Look" company brought out its '57 models and started saying, "suddenly it's 1960," the industry didn't realize how true the statement was.

Fins have paid off for Chrysler, and the company has no intention of changing present styling trends for the next two years.

Although the 1958 Chrysler products underwent what used to be considered a conventional face-

(Material in this department is protected by copyright, and its use in any form without permission is prohibited.)

lift (grilles, lights, and trim), 1959 cars are expected to veer more to sculptured styling in sheet metal areas.

GM—The largest member of the Big Three looks like the only one that's still not convinced it wants to keep present body shells. With the exception of Cadillac, the other divisions still seem to be looking around for a better theme.

Chevrolet has made the most of GM's loaf-of-bread concept in its '58 cars. But even Chevy isn't satisfied. It's rumored that the division will make a second major styling overhaul on 1959 autos.

Dopesters claim two more GM divisions will add fins to present bodies in '59.

AMC—Unitized bodies eventually will give American Motors an opportunity to revise its styling if George Romney, AMC's president, changes his mind.

So far, Mr. Romney indicates he believes economy—in design as well as in operation—will pay off better for AMC. The Rambler series shows no signs of drastic styling changes for the next two years.

One thing is clear: Cars can't get much longer or lower. The Big Three aren't going to retreat. Styles will be refined to make cars look longer, lower, and sleeker without actually changing basic body dimensions.

GM, Chrysler Earnings

General Motors Corp. reports nine-month sales of \$8.2 billion, compared with \$8.1 billion at the 1956 third quarter mark.

Net income for the same period is \$603 million, compared with \$640 million last year.

The 6 per cent drop in income has been caused mostly by a slump of 9 per cent in 1957 car deliveries.

In the first three quarters, GM has produced (U. S. only) 2,119,943 cars and 314,447 trucks. It turned out 2,355,313 cars and 337,175 trucks in the same period last year.

Average employment is about 20,000 less than it was in 1956.

The company expects the loss in income will be less than 6 per cent for the whole year because of an anticipated sales pickup in the fourth quarter.

Chrysler—Nine-month earnings of Chrysler Corp. show it has a net income of \$103.5 million, compared with \$6.2 million in 1956.

In 1955's record year, Chrysler had earned \$70.6 million at the end of three quarters.

Reported sales so far this year are \$2.7 billion, versus \$1.8 billion last year.

The company says it has sold 1,082,801 cars and trucks in nine months. For the same 1956 period, it reported 763,718 unit sales.

Specs on 1958 Cars

Here are the basic body and engine specifications for the Ford, Chevrolet, and Plymouth pictured on the preceding page:

Chevy's Impala—It comes in a convertible and sport coupe in the Bel Air series. Wheelbase is 117.5 in.; length is 209 in. The car is 2.5 in. lower than last year's.

The Impala is powered by a 348 cu in. V-8 with a 9.5:1 compression ratio. Four-barrel carburetors are standard; horsepower is 250/4400 rpm.

Fairlane 500—Ford's low-priced, luxury car for 1958 is 207 in. long, with a 118 in. wheelbase. It is 56 in. high, 78 in. wide, carries a 2.91:1 axle ratio with Fordomatic transmission.

The standard engine for the 500 is a 332 cu in. V-8 with a 9.5:1 compression ratio and two and four barreled carburetors. With four barrels, the engine is rated at 265/4600 rpm horsepower. Torque is 360/2800 rpm.

Plymouth — Chrysler's low priced cars have the same body dimensions as they did in 1957, but they're powered by a new family of engines.

Standard powerplant for Plymouth lines is the Fury V-800. This engine has a 9:1 compression ratio, 318 cu in. displacement. With dual carbs, it has a torque ratings of 330/2800 rpm. Horsepower is 225/4400 rpm. An optional 315 hp engine is equipped with fuel injection.

Boost Tire Prices

Tire manufacturers report a 22 per cent price increase for original equipment tires sold to auto manufacturers. The increase took effect Oct. 1. The last tire price boost was 3 per cent in July.

Auto industry sources indicate the increase will be passed along to 1958 car buyers although it will be buried in the total car price.

Original equipment sales for passenger cars, trucks, and buses generally account for one-third of total tire sales. Replacement sales make up the remainder.

Last year, tire builders shipped about 53.3 million passenger car replacement tires, according to E. F. Tomlinson, president, B. F. Goodrich Tire Co., Akron, division of B. F. Goodrich Co.

For 1958, Mr. Tomlinson looks for a 6 per cent increase in replacement tire sales to the passenger car market.

Exhaust Notes

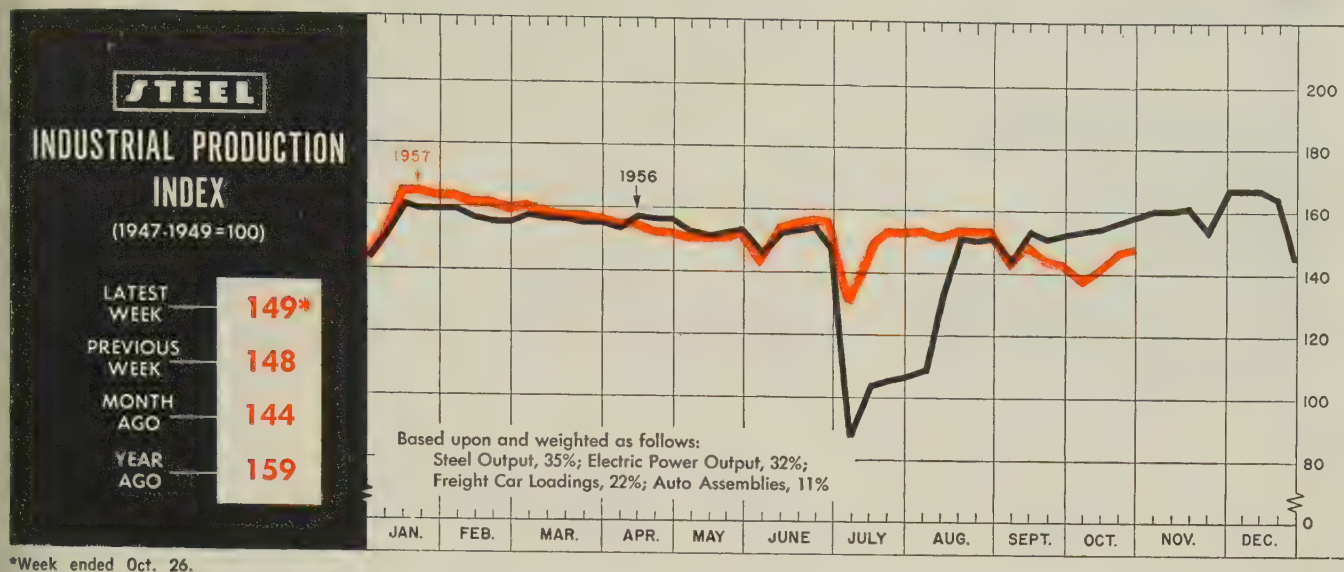

- The Edsel contains 36 lb of stainless, says Richard E. Paret, of the stainless steel producers committee, American Iron & Steel Institute.

- Harlow Curtice, GM president, reports the firm's \$204.5 million expansion program in Europe is virtually completed. He foresees expanding markets for autos, appliances, and other consumer goods in Western Europe.

Business Is Good Despite Caution Mongers

IN TERMS of dollar volume, and, in many cases, physical volume, a lot of businessmen are going to enjoy one of their best years on record. But to hear them talk, you'd think that 1957 is a throw-back to 1949 or 1954.

Much of their pessimism stems from a negative appraisal of performance. Many goals for 1957 were set with one thing in mind: Beat the bejabbers out of 1956, just as 1955 records were smashed in 1956. The "ever onward, ever upward" concept leaves no room for second best.

Counter to Facts—During the last two weeks, STEEL has spot-checked the business expectations of key capital goods producers (Oct. 21, Page 42) and component suppliers (see Page 65). Generally, their shipments are better than they were in the third quarter and about on a par with those in last year's fourth quarter. Yet there is an amazing amount of apprehension among even the most successful businessmen this year.

The Facts—The latest facts and best estimates are these:

1. Monthly industrial production as measured by the Federal Reserve Board matched or bettered the year-ago marks through September. In the annual survey of economists' opinions conducted by F. W. Dodge Corp., New York,

the median projection of 202 participants for the December index reading was 145 (1947-49 = 100), or a decline of only 2 percentage points. The economists expect a dip to 144 in 1958's first half and a rise to 146 by December, 1958.

2. Gross national product in the third quarter was at a record

annual rate of \$439 billion. The economists anticipate a leveling off at an annual rate of about \$440 billion until the second quarter of next year, followed by a steady rise to \$449 billion by the end of the year.

3. New plant and equipment expenditures this year will total

about \$37 billion. The economists' median forecast for 1958 was a mild dip to \$36 billion—second best, but still good.

4. New construction is rolling along at a \$47 billion annual clip, and the Dodge survey indicates it will continue at this rate through 1957 and 1958.

5. Personal consumption expenditures are running at a record \$278 billion, and the consensus is that the second half rate will be \$280 billion. Next year will see a \$285 billion rate. It figures: Net spendable earnings are continuing to rise monthly. Latest figures from the Bureau of Labor Statistics (for September) showed that the takehome pay of a worker with three dependents rose to \$75.63 a week, 32 cents higher than it was in August.

That gain more than offset the slight rise in consumer prices to 121.1 per cent of the 1947-49 base in September. Most economists feel the rise in the cost of living is losing steam. Coupled with built-in wage hikes, this leads to the conclusion that the consumers' buying position will strengthen within the next year.

In the face of such facts and projections, it's hard to justify

the prevailing wait-and-see attitude. You can't measure the effects of psychology.

PAs Lose Optimism

You can detect some caution in the latest report of the National Association of Purchasing Agents. New orders, production, and employment in October were down from September levels. And purchasing executives are reluctant to commit themselves too far into the future, especially in regard to capital goods. One of the bright spots of the report is the feeling that commodity prices have stabilized. Exception: Some metal prices continue to weaken.

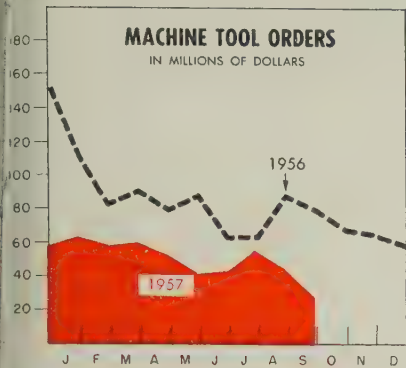

Index Continues Climb

STEEL's industrial production index continued to edge up during the week ended Oct. 26 despite downturns in steel output and freight car loadings. It reached 149 (1947-49 = 100), 9 points above the low point of a month ago. The buildup in auto production and a slight rise in the output of electricity overbalanced the weaknesses.

Steel operations are the big dis-

appointment in the production picture. Despite the increased consumption of its No. 1 customer—motordom—the industry has seen its operating rate slide from 2,115,000 net tons for ingots and castings during the week ended Oct. 6 to a 15-week low of 2,024,000 tons last week. The industry had been expected to operate at about 85 per cent of capacity at this time, but the current rate is only 79 to 80 per cent.

Industry Reports

- Orders for industrial furnaces in the first nine months of this year total \$45.6 million, down 25 per cent from the corresponding figure for 1956, reports the Industrial Heating Equipment Association Inc., Washington. September orders amounted to \$2,337,000, about 24 per cent under the September, 1956, figure. Orders for induction and dielectric heating equipment are down 15 per cent from the year-ago total.

- Class I railroads installed 99 locomotive units in September, bringing the nine-month total to 1019, says the Association of American Railroads, Washington. This compares with 1125 units for

the corresponding 1956 period. The order backlog on Oct. 1 was 296 units, compared with 737 in 1956.

- For the first time since last February, in September structural steel fabricators failed to ship over 300,000 tons of steel a month, says the American Institute of Steel Construction Inc., New York. Shipment of 294,719 tons was still 22 per cent above the year-ago figure, however, and the nine-month total remains 17 per cent better than the corresponding 1956 level. Bookings in September were up from August's, but the cumulative total is 23 per cent off the 1956 pace.

- Manufacturers of metal furniture continue to show improvement in shipments and orders. September orders rose 3 per cent above the year-ago position while shipments advanced 5 per cent, says the National Association of Furniture Manufacturers Inc., Chicago.

- Members of the American Supply & Machinery Manufacturers' Association are having their best year on record. The association's new order index for September rose to 203 (July, 1948 = 100), bringing the nine-month average to 205.3. The monthly average last year was 201.8.

Retaining ring

How one machine hardens them all *without distortion*

You can quench any part quickly from a hot, plastic state without warpage or distortion when you work with Gleason Quenching Presses.

Since no straightening operation is necessary after hardening you save time and

make a definite advance in quality control. Experience shows there is much less residual stress in non-straightened parts.

A button is pressed and the automatic quenching cycle is started. The lower die is swung back into the quenching position and the upper die descends rapidly, aligning the part while it is still in the plastic state.

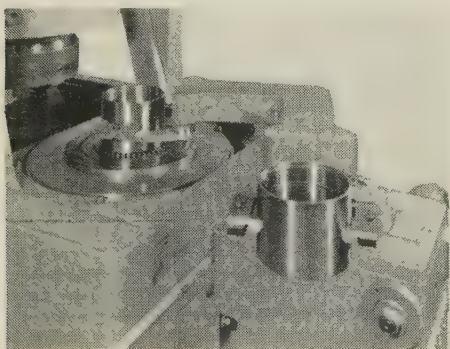

Carefully controlled metallurgically correct oil circulation cools and hardens the part uniformly to preset rates.

The two dies align the part throughout cooling, allowing the part its normal contraction but keeping it true. After the quench, the part is swung out for removal.

As shown in the photograph at the left, Gleason Quenching Presses can be arranged with a completely automatic load and unload unit.

You can harden *any* part, regardless of shape, with this method. There are three presses accommodating parts up to 36" diameter. Still another Gleason Press automatically hardens and straightens shafts and similar parts up to 4" in diameter and 40" long.

Write for literature on the presses. And for recommendations on the press and dies that best fit your products, send us blueprints.

The Gleason Nos. 16 and 26 Quenching Presses can be arranged with the load and unload unit. This unit makes it possible to speed production and reduce labor requirements.

gen. mgr., Butterfield Div.

Alvin J. Jones was made director of engineering at **Motch & Merryweather Machinery Co.**, Cleveland. He will direct all engineering activities at Cleveland as well as at the Avey Div., Cincinnati. Mr. Jones was chief engineer with Landis Tool Co.

Reese Lloyd was appointed vice president, **Kelsey-Hayes Co.**, Detroit. He continues as president of the newly formed Heintz Div., Philadelphia.

Donald W. Douglas Jr. was named president, **Douglas Aircraft Co. Inc.**, Santa Monica, Calif. He succeeds his father who retains his post as chairman. **Frederick W. Conant**, senior vice president, was named to the new post of vice chairman.

Dr. A. M. Aksoy was made manager of **Crucible Steel Co. of America's** new applied research laboratory, situated at the Sanderson-Halcomb Works in Syracuse, N. Y. He was chief metallurgist for Vacuum Metals Corp., an operating division of the works.

Gerald C. Saltarelli was elected to the new post of senior vice president, **Houdaille Industries Inc.**, Buffalo, with executive responsibilities for all Houdaille manufacturing plants and units. He was vice president-operations.

Charles E. Nelson Jr. was named executive vice president, **Waukesha Motor Co.**, Waukesha, Wis. **Newton H. Willis** was named vice president-engineering.

David T. Morgenthaler was elected president of **Foundry Services Inc.**, Columbus, Ohio, to succeed **Eric Weiss**, who continues as chairman. Mr. Morgenthaler was vice president of marketing with Delavan Mfg. Co.

T. Laurence Strimple was elected president, **National Acme Co.**, Cleveland. He succeeds **Fred H. Chapin**, who continues to serve as board chairman. Mr. Strimple was secretary and general counsel.

Ralph W. Palmer was named technical sales manager, **John S. Barnes Corp.**, Rockford, Ill. He continues as assistant chief engineer.

Harlan E. Eastman was made purchasing agent, **Helipot Div.**, Beckman Instruments Inc., with headquarters at Newport Beach, Calif.

Elbert G. Bellows was elected a vice president, **W. L. Maxson Corp.**, New York. He was assistant vice president, contracts division. **William P. McNally** was made sales manager; **Joseph W. Stehn**, assistant sales manager. Mr. McNally succeeds **John W. Bjorkman**, resigned.

C. Edwin Ponkey was elected president of **Dallas Tank Co. Inc.**, Dallas. He joined the firm in August as general manager and assistant to the president. **Henri Jennings** was made vice president of liquefied petroleum gas sales; **Allen Peairs**, vice president of custom sales. **George Cook** joined the company as factory manager of the Dallas plant.

George M. Brydon was appointed general manager, **Butterfield Div.**, Union Twist Drill Co., at Derby Line, Vt. He succeeds **Martin C. Butters**, resigned. He was director of manufacturing for all divisions of **John Bertram & Sons Co. Ltd.**, Dundas, Ont.

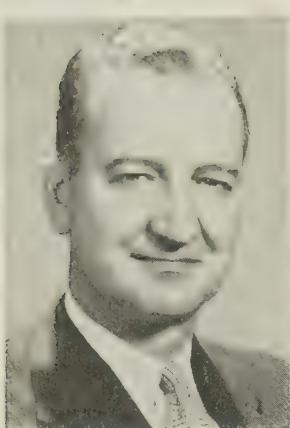

Robert E. Fromson was named works manager, **Bryant Electric Co.**, Bridgeport, Conn., subsidiary of Westinghouse Electric Corp. He is responsible for manufacturing, production, and maintenance activities of the Bridgeport and Danielson, Conn., plants.

Edward J. Mulroony was made regional manager, **Baker-Raulang Co.**, subsidiary of Otis Elevator Co. With headquarters in New York, his area extends from Maine to Virginia.

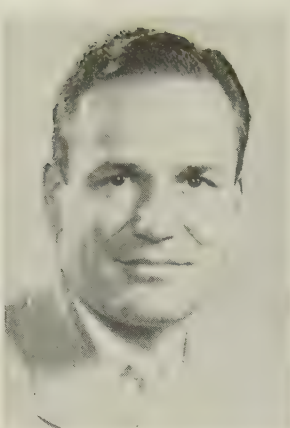

Edwin Hodge Jr. was elected chairman, **Westinghouse Air Brake Co.**, Wilmerding, Pa. He continues as president and chairman of Pittsburgh Forgings Co. At Westinghouse Air Brake, he succeeds **Edward O. Boshell**, resigned.

John T. Castles was made sales manager for the silicone products department of **General Electric Co.**, Waterford, N. Y., succeeding **Jerome T. Coe**, who becomes the department's marketing manager. Mr. Castles was manager of rubber market development.

Charles A. Schulte was made manager of **Vanadium Corp. of America's** new Vancoram, Ohio, plant. **Albert J. Primosic** was made man-

ager of the Niagara Falls, N. Y., plant to succeed Mr. Schulte.

At the Peoria, Ill., plant of Caterpillar Tractor Co., Gordon Swardenski was made assistant plant manager and is succeeded as manufacturing manager by Charles E. Verkler. Robert E. Gilmore was named assistant manufacturing manager. Thomas H. Spencer heads a new quality control department. A. L. Jerome succeeds Mr. Spencer as plant metallurgist.

Jerry Cummins was made general sales manager, Atlas Precision Products Co., division of Prudential Industries Inc., Philadelphia.

Mathias A. Gatzweiler was made production control manager, Jackson Div., Aeroquip Corp., Jackson, Mich. He was production control supervisor at the Elbecco Div., also in Jackson.

William A. Kerr was made general sales manager, electronics and instrumentation division, Baldwin-Lima-Hamilton Corp., in Waltham, Mass. He was vice president-general manager, nuclear divisions, Tracerlab Inc.

Reynolds Aluminum Sales Co., Louisville, appointed three vice presidents: William T. Ingram, general sales manager for Reynolds Metals Co.; and Paul Murphy and Charles M. Mapes, general managers for the company's packaging and consumer market sales divisions, respectively.

John R. Davis was appointed southeastern representative for Osborn Mfg. Co.'s machine division. He is at Chattanooga, Tenn.

At E. W. Bliss Co., Canton, Ohio, William Staecker, former chief engineer, Canton division, joins the general office staff as assistant manager of engineering for the press division. Alfred Drain succeeds Mr. Staecker.

John E. Blomquist was made vice president-general manager of the Great Lakes sales region for Reynolds Aluminum Sales Co. He is at Detroit. He previously was general sales manager, industrial fabricating division, in Louisville. DuPont Yager, former Detroit regional manager, was named vice president-automotive sales.

James Armour was made sales manager, cutting tool division, Brubaker Tool Corp., Millersburg, Pa. He was assistant sales manager of the division, and is succeeded by Mark E. Cooper.

A. H. Kappenberger fills the new post of assistant to the president, Peerless Steel Equipment Co., Philadelphia.

Sylvan J. Cromer was appointed vice president-engineering, Union Carbide Nuclear Co., division of Union Carbide Corp., New York.

Charles J. Brown was made sales manager, Cuban American Nickel Co., subsidiary, Freeport Sulphur Co., New York.

J. George Miles was made assistant to the vice president-Sheffield Div., Armco Steel Corp., at Houston.

Fred H. Ueckermann was named Chicago district manager, wire rope division, John A. Roebling's Sons Corp., succeeding Carl H. Walles,

resigned. Mr. Ueckermann headed the Atlanta district office, and is replaced by Harry L. Truitt Jr.

Edward H. Durkee was elected secretary-treasurer, Great American Industries Inc., Elyria, Ohio.

N. Kerry Patterson and Paul E. Richard joined the sales staff of the Los Angeles office of L. B. Foster Co. Mr. Patterson specializes in highway products sales. Mr. Richard handles tubular product sales.

Ralph R. Wyckoff was made sales promotion manager, A. J. Gerrard & Co., Melrose Park, Ill.

George W. Edick was made sales manager, domestic division, Cooper - Bessemer Corp., Mt. Vernon, Ohio.

Russell S. Rockafellow joined Raytheon Mfg. Co., Waltham, Mass., as manager of industrial engineering. He was director of production engineering, Chrysler Corp.

Alan E. Bodycombe was appointed to the Michigan sales engineering staff of Mechanical Handling Systems Inc., Detroit.

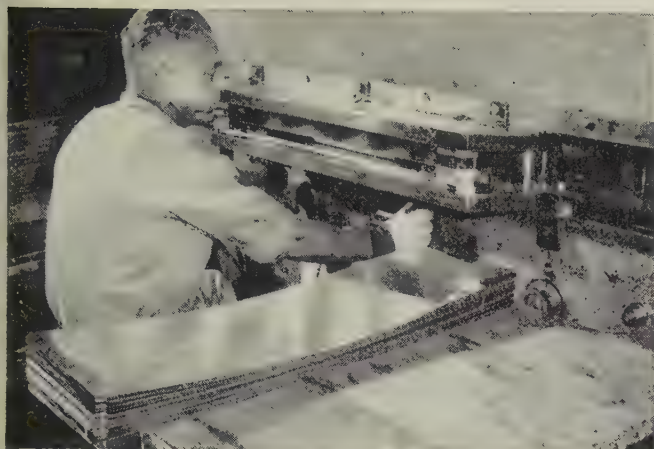

B. H. Puerner, assistant manager, processing machinery department, Allis-Chalmers Mfg. Co., Milwaukee, was named manager of special projects for Allis-Chalmers International.

H. F. Robertson was made technical director of Union Carbide Development Co., New York, division of Union Carbide Corp.

Jerome McInnes was made engi-

Production Takes A Short-Cut

With Pre-Plated NICKELOID METALS

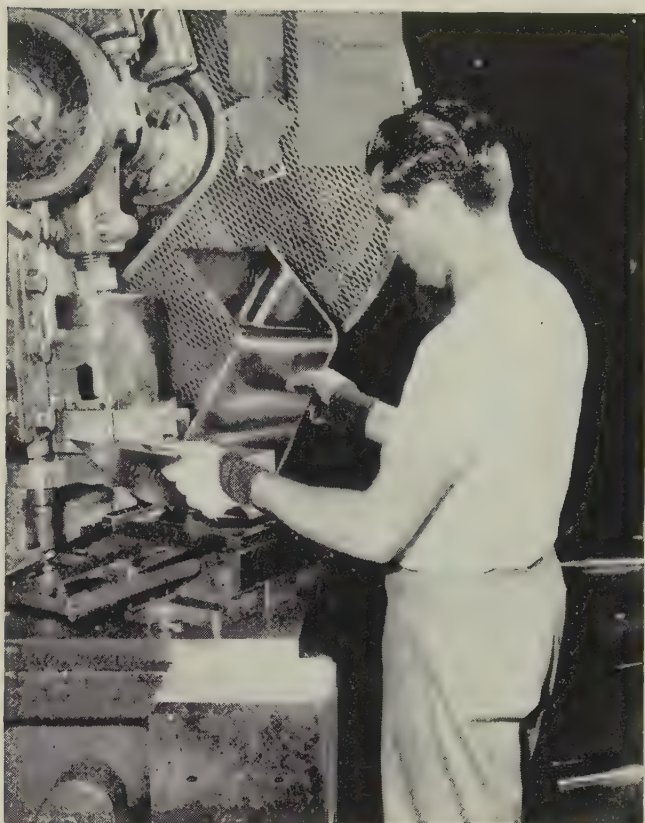

Sheet of Nickeloid chrome-steel that will be used for breadbox is blanked, with punch-out perforations for ventilation and indented shelf supports. Uniform pre-plated finish reduces rejects.

Edges of Nickeloid chrome-steel sheet are turned up $\frac{1}{2}$ " in forming press. Nickeloid is easily worked with standard methods.

Breadbox body frame is spot welded to the preformed bottom and back pieces, with no visible oxidation. Parts then move to assembly.

Two bends are made on press to give the breadbox its rectangular shape. Operation causes no marring of surface or dulling of finish.

No Cleaning or Post-Plating — Easily Worked With Standard Production Methods

No cleaning solutions, plating tanks or polishing wheels on the production line at Lincoln Metal Products Co., Brooklyn, N.Y., manufacturer of fine pantryware. Lincoln eliminates these costly intermediate steps by using Nickeloid pre-plated chrome-steel and copper-steel. These versatile design materials speed trouble-free production, reduce rejects, prolong tool life. They are readily worked with standard production methods, as shown here. Parts move from fabrication — to assembly — to packing, with no dulling or marring of the pre-plated finish, since Mar-Not protective covering is used. No cleaning, plating, polishing is needed. Nickeloid Metals are available in pre-plated finishes of chrome, nickel, copper or brass on steel, zinc, copper, brass and aluminum. Sheets, strips, coils — a wide range of finishes and patterns.

To Make Line Pipe

Steel and aluminum products up to 14 in. will be made by Aluminum Tubing Co. in Florida

ALUMINUM TUBING CO., Jacksonville, Fla., will install a mill for the manufacture of steel, stainless steel, and aluminum pipe and tubing. (Sizes: 4.5 to 14 in.) It is scheduled to be in operation in March, 1958, says H. H. McCarl, general manager.

Steel pipe will be welded by the electrical resistance process, using equipment manufactured by McKay Machine Co., Youngstown. Stainless steel and aluminum pipe will be welded by the inert gas shielded, tungsten arc process and the high frequency resistance process.

Steel pipe will be produced for oil and gas gathering, transmission and distribution lines, water and oil well casing, municipal and project water systems, and construction piping. Aluminum pipe will be manufactured primarily for the irrigation industry. Stainless steel pipe and tubing will be produced for the chemical processing and related industries.

The company says it produces about 10 per cent of the aluminum irrigation tubing made in the U. S.

Will Offer Lipe Bar Feed

Brown & Sharpe Mfg. Co., Providence, R. I., will sell an automatic, magazine loading, bar feed manufactured by Lipe-Rollway Corp., Syracuse, N. Y., for installation on Brown & Sharpe single-spindle automatic and hand screw machines.

Huge Press in Operation

Harvey Aluminum, Torrance, Calif., has placed in operation an extrusion press capable of exerting a force of 12,000 tons. This press and a companion 8000-ton press at the Harvey mill are part of the Air Force heavy press program. The 12,000-ton press has an over-all length of 300 ft and weighs 4 million lb. It can extrude aluminum sections from ingots 32 in. in diameter and 75 in. long.

Supporting facilities include vertical heat-treat furnaces as high as 110 ft, two large stretch-straighteners of 1.5-million and 3-million lb capacity, and an array of furnaces, heaters, and casting equipment.

Century Changes Name

Century Engineers Inc., Burbank, Calif., is changing its name to Royal Industries Inc. Century Electronics & Mfg. Co. will operate as a subsidiary.

GE Installs Furnace

General Electric Co. has installed a 108-ft roller-hearth furnace as part of a new automated production line for its Small AC Motor & Generator Dept. at Schenectady, N. Y. The furnace, designed by GE's Industrial Heating Dept., Shelbyville, Ind., anneals both the stator punchings and weld in one pass. It anneals up to 3000 lb of rotor and stator cores in one hour.

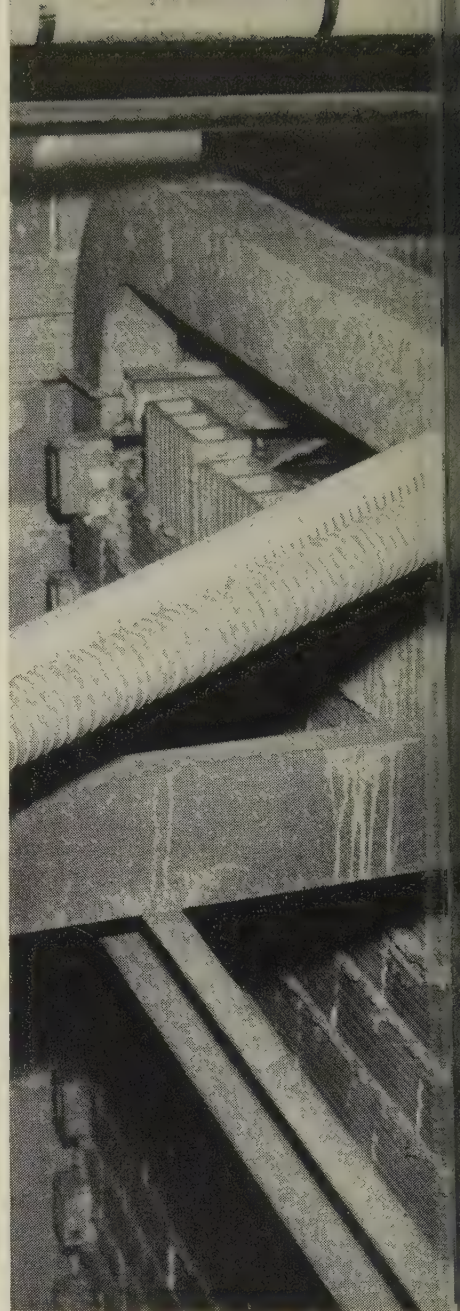

Sylvania Renames Division

Sylvania Electric Products Inc.'s Tungsten & Chemical Div., Towanda, Pa., changed its name to Chemical & Metallurgical Div. Sylvania's activities in the fields of chemistry and metallurgy include the production of tungsten, molybdenum, germanium and silicon semiconductor materials, phosphors, plated fine wires, and special chemicals. At present, the division produces almost every type high purity chemical and metal material used by the electronics industry, as well as materials for the high temperature alloy metals industry. A 50,000 sq-ft research and development laboratory will be placed in operation soon.

Forms Tool & Mfg. Div.

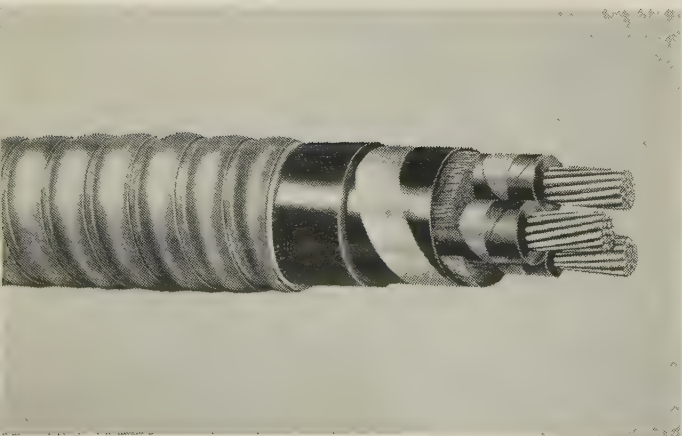

A. O. Smith Corp., Milwaukee, has enlarged and given divisional status to its Milwaukee plant tooling facilities. Tool & Mfg. Div. manager is Elmer A. Widerborg, who will report to Fred Mackey, vice president-manufacturing. The firm is a fabricator of automobile frames and suspension system

For air conditioning: Three conductor, 500 Mcm, 37 wire, $\frac{6}{64}$ " varnished-cambr insulated Anaconda Duralox Cable was quickly, easily installed in older building

PROBLEM: Installing new circuits in old building

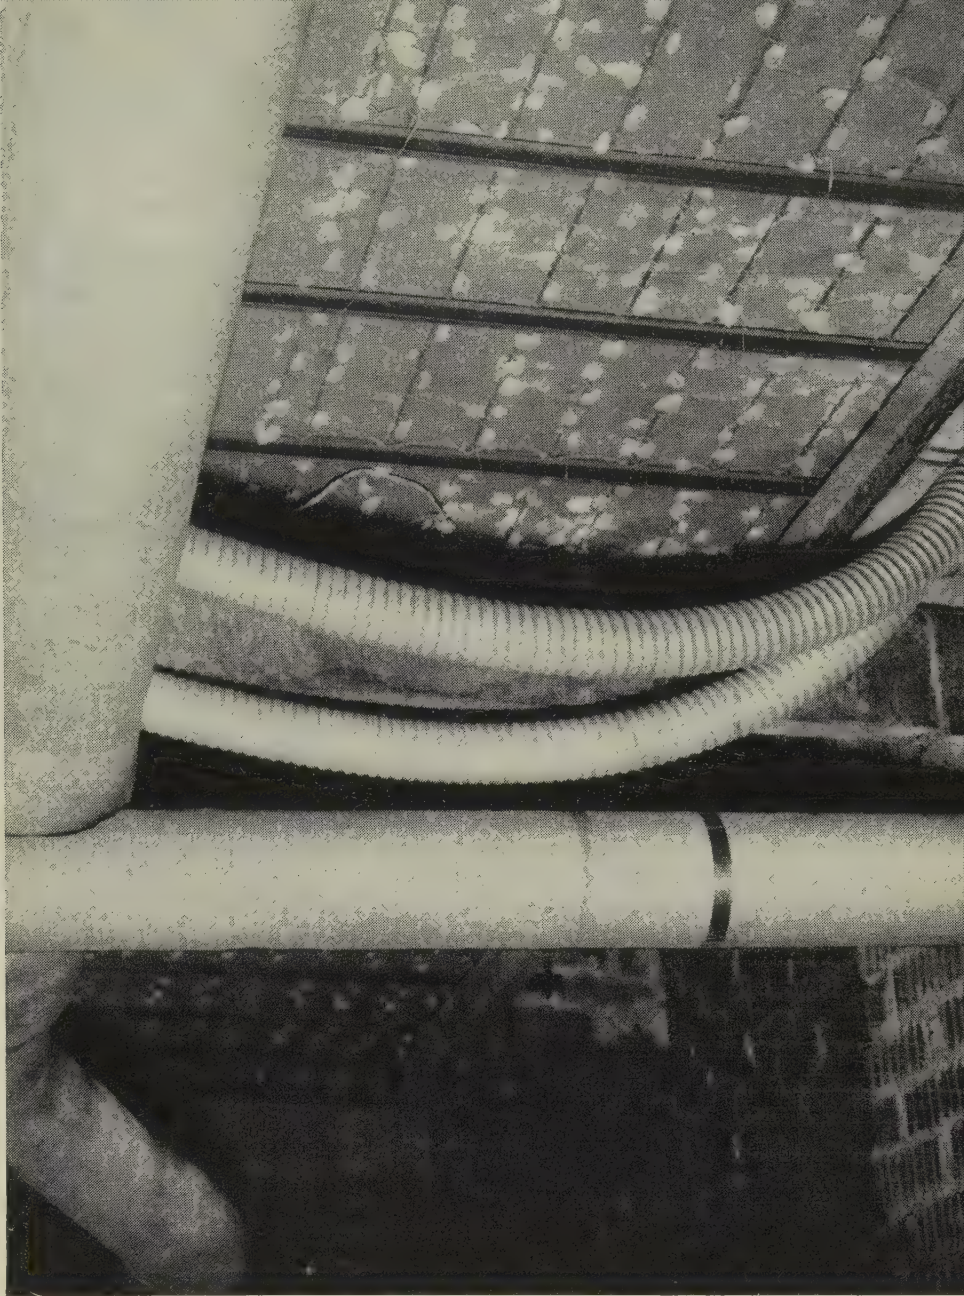

Anaconda Duralox Interlocked-armor Cable.

Installing new circuits in an old building — whether for air conditioning, as the case here, or for new machinery or new load centers — can be tough and costly. You either have to go around existing obstructions, a laborious job with rigid conduit, or remove them.

The ideal solution is Anaconda Duralox Interlocked-armor Cable.

Because it is flexible, Duralox Cable is quick and economical to install — indoors or out — with simple supporting devices. It trains easily around corners, columns and other obstructions in *long, unbroken*

handle new load. Cable runs from breaker box in west wing (left) through loft of roof (center) to side wall of building and down wall (right) to breaker box on lower floors.

SOLUTION: Duralox Interlocked-armor Cable

or: How to do a hard job the easy (and low-cost) way

ms. Circuits are easy to relocate . . . always accessible. Duralox's interlocked metal-tape armor affords excellent protection against mechanical damage.

Anaconda Interlocked-armor Cable is available in sizes No. 6 Awg to 750 Mcm — copper or aluminum conductors — up to 15 Kv. Underwriters' ap-

proved for 600 volts and 5000 volts. With rubber, plastic, or varnished-cambric insulation.

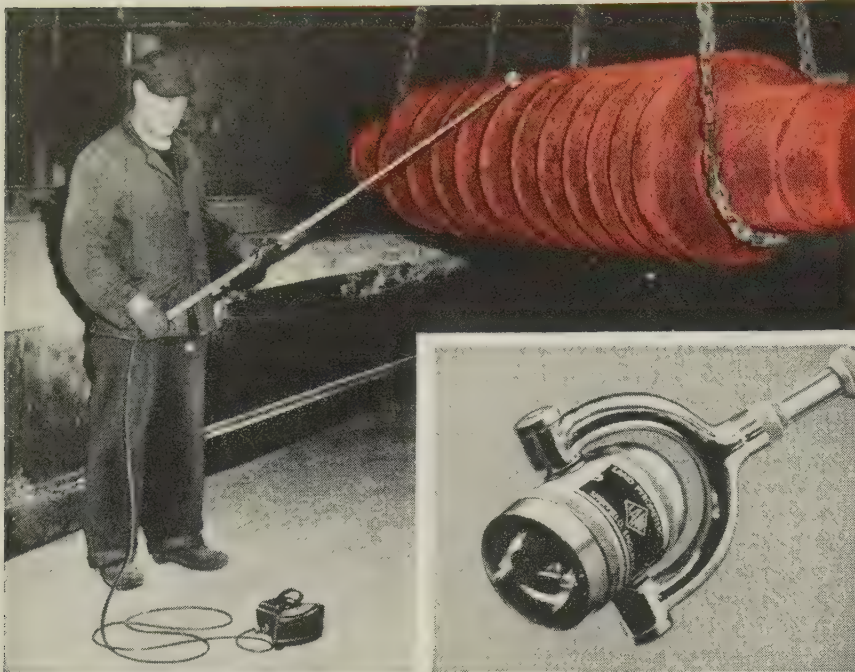

NEW BULLETIN DM 5606 on Anaconda Duralox Cable gives you full information. Write for your copy today. Anaconda Wire & Cable Company, 25 Broadway, New York 4, New York.

Now Check Surface Temperatures to $\pm 0.5\%$ in Only 5 Seconds

New from Fielden, the Land Portable Pyrometer provides direct readings... in only 5 seconds... of refractory and metal surface temperatures between 100° F. and 2400° F. No emissivity corrections are required, yet this pyrometer is accurate within $\pm 0.5\%$.

The Land Pyrometer not only transmits radiation under near-perfect black body conditions, but fully compensates for changes in ambient and radiation head temperatures. It also features a telescoping arm and can be used with a rugged Fielden millivoltmeter, spot galvanometer, or portable high-speed indicator or recorder.

WRAP UP TEMPERATURE WITH **Fielden**

Fielden simplified instrumentation can solve practically every temperature problem. For measurement you can choose from low-cost voltage or current recorders, null-balance recorders for up to 96 points, manual monitors, automatic scanners, and specialized radiation or suction pyrometers. Fielden controllers range from electric on-off types up to proportional pneumatic controllers. In addition, Fielden supplies a complete line of sensing elements, accessories and supplies.

components. Dies used to manufacture these components are made by A. O. Smith's tooling facilities. The division also turns out tools for Smith's line pipe, pressure vessel, and aeronautical and water heater operations.

Enters Thermostat Field

Norwalk Thermostat Co., Norwalk, Ohio, has been formed to manufacture a line of electric thermostats. Operations will start by Nov. 15. Officers are: President, Dale Callihan; vice president, Edward Arlin; secretary, Rex V. Larson; and treasurer, Dr. Donald Dewald.

Lehigh Sells Part of Line

Lehigh Inc., Easton, Pa., sold its newest automotive air conditioning compressor and related manufacturing facilities to the York Div. of Borg-Warner Corp., Chicago. Lehigh will concentrate on hermetic and open type condensing units and other refrigeration products.

Statham Changes Name

Statham Laboratories Inc., Los Angeles, changed its name to Statham Instruments Inc.

To Grow Single Crystals

Single Crystal Corp. of America has been organized at Saxonburg, Pa., to grow single crystals of various materials. Many such crystals have electronic, optical, and nuclear applications.

Boosts Ceramic Operations

The ceramic manufacturing operations of Sylvania Electric Products Inc., New York, have been made a unit of the Parts Div., Mineola, N. Y. Present manufacturing facilities at Mineola, which produce small ceramic components for electron tubes and connectors, will be expanded for the manufacture of a wide variety of precision ceramic parts and vacuum-tight ceramic-to-metal composites. Among the ceramic components manufactured by Sylvania are tub-

STEEL PLATE

Fabricating Facts!

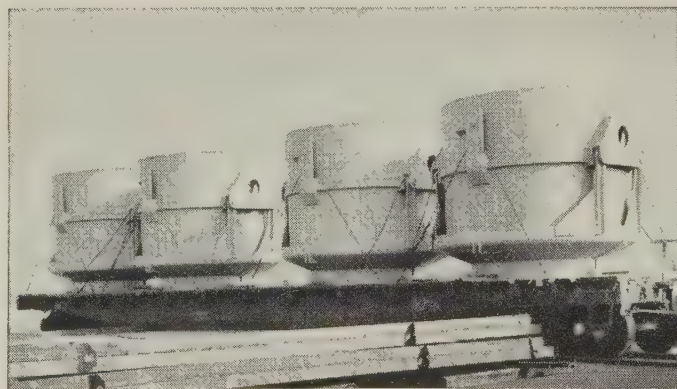

McGREGOR-MICHIGAN Brochure Describes Diversified Facilities and Production

In this compact 12-page brochure you'll find valuable information on McGregor-Michigan's equipment and typical steel plate fabrications. It shows scenes in our new 30,000 square foot Heavy Fabricating Plant and our original Rivard plant. It describes some of our new equipment including a 650 ton press brake and our 600 ton "Bulldozer" horizontal forming press capable of forming heavy beams or solid sections. In addition you'll find clear illustrations of steel plate fabrications for the primary metal producers—ladles, buckets, hooks, doors, water-cooled roof rings and others—and equally interesting chemical and petroleum processing equipment—ASME Code vessels, autoclaves, heat exchangers, kettles and tanks. Many of these assemblies run to 50 tons and over, in mild, stainless and alloy steels. Typical miscellaneous industrial fabrications shown are engine beds, bases

for machines, jigs and fixtures, heavy-wall cylinders, foundry cupola shells, furnace casings, a self-propelled sewer tunnel shield and a heavy boom for a power shovel. The brochure also describes our plate warehousing and specialized surface treating services.

We would appreciate your including this informative booklet in your file of fabricating sources. Please send for a copy and the name of our representative nearest you or call direct for prompt service on any steel plate fabricating problem.

Enters Automation Field

Aerojet-General Corp., a subsidiary of General Tire & Rubber Co., Akron, primarily engaged in research and development on guided missiles and rockets, has entered the field of automation. It has designed an automatic machine for cutting and marking the steel plates used in shipbuilding. The device "reads" 1/10 scale drawings and automatically directs torches and punches which cut and mark 12 by 50-ft steel plates.

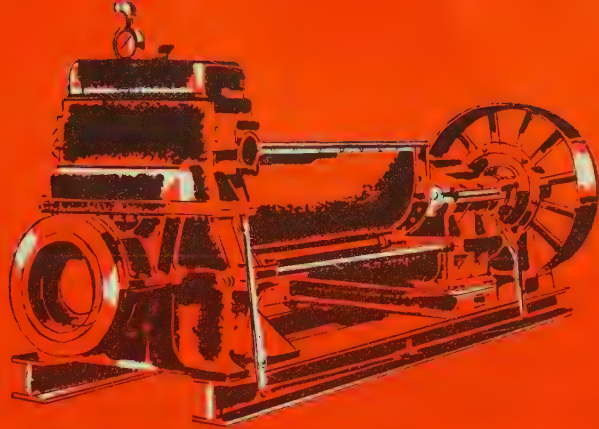

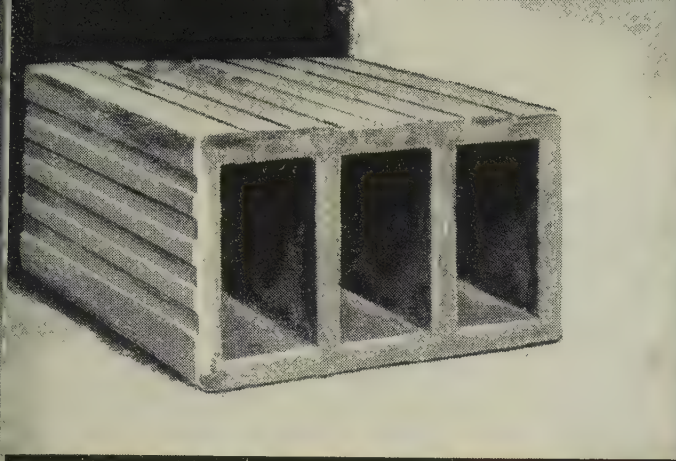

CONSOLIDATIONS

Adirondack Foundries & Steel Inc., Watervliet, N. Y., will sell its name, business, machinery, and equipment to Consolidated Foundries & Mfg. Corp., Chicago. If stockholders approve, Adirondack Foundries will retain ownership of real estate and buildings and will lease them to Consolidated.

Pantex Mfg. Corp., Pawtucket, R. I., purchased Spinform Inc., Attleboro, Mass., specialist in forming and spinning all types and gages of metals and alloys.

Dresser Industries Inc., Dallas, will acquire Gardner-Denver Co., Quincy, Ill., producer of compressors, pumps, rock drills, and air tools. Gardner-Denver will be combined with four other subsidiaries of Dresser to form a new wholly owned subsidiary, Gardner-Dresser Co., with headquarters at Quincy. The organizations that will be combined are Gardner-Denver; Clark Bros. Co., Olean, N. Y.; Pacific Pumps Inc., Los Angeles; and Dresser's divisions: Roots-Connorsville Blower, Connorsville, Ind., and Ideco, Dallas. G. V. Leece, president of Gardner-Denver will be chief executive officer of Gardner-Dresser.

Buhr Machine Tool Co., Ann Arbor, Mich., purchased Sidney Machine Tool Co., Sidney, Ohio, manufacturer of heavy duty, precision metalworking lathes. Administra-

No Margin for Air— No Margin for Error

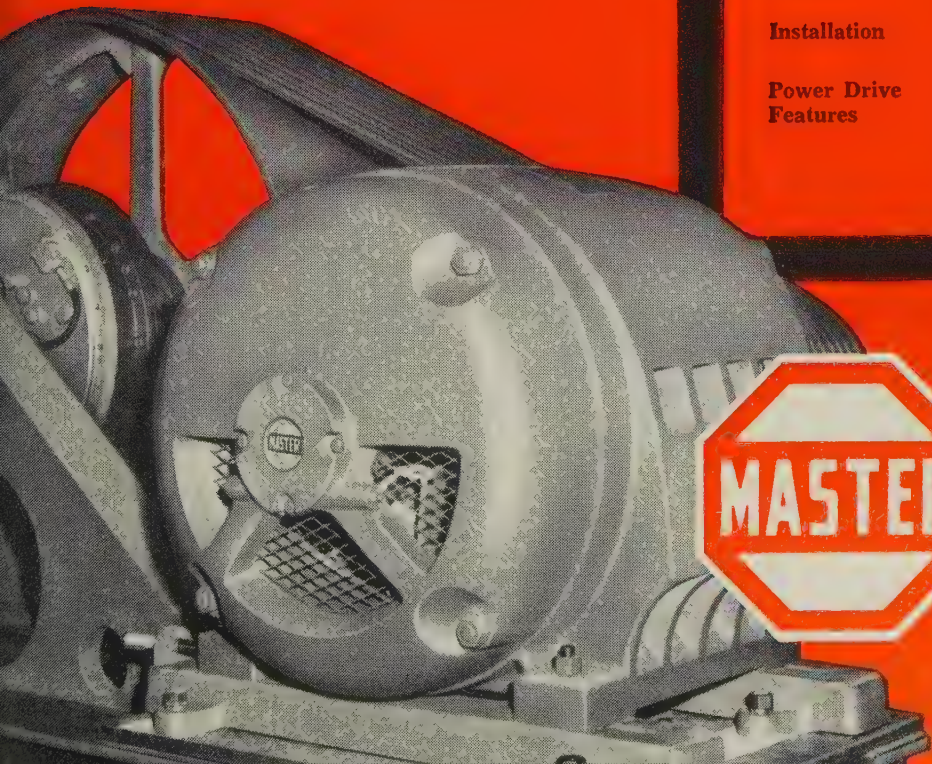

ANOTHER DRIVE REQUIREMENT MEETS ITS MASTER

Yes, it's a fact—unless you remove the air from the clay, you get a no-good tile. And whether air is your problem, or not—error is always a problem. And it's never a mistake to come to Master for the right power drive. In every kind of industry, Master customized package drives give you the utmost in flexibility, compactness and performance.

Here, the primary requirement is power—and the husky, big 200 H.P. Master fills the bill year in and year out. Your requirements might be better met by integrating Master components into a single, efficient, compact unit for the right horsepower, right shaft speed and right mounting features. What are they?

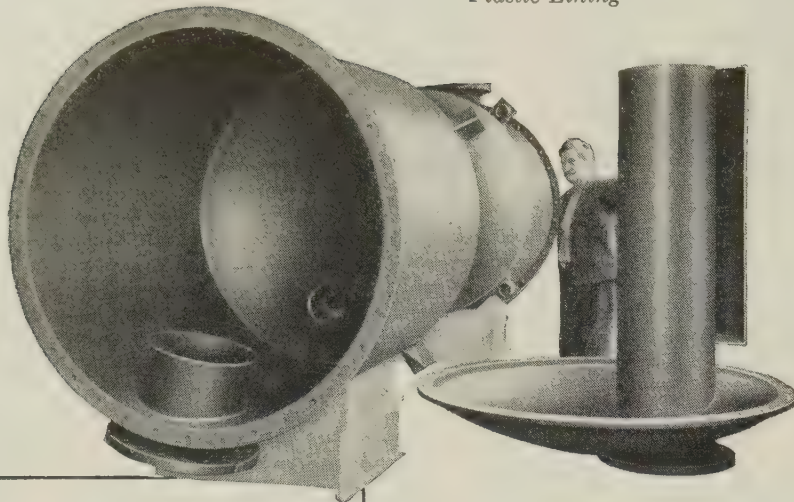

A husky 200 H.P., 440 volt squirrel cage induction Master Motor powers this 14-ton De-Airing Brick and Tile Machine with a capacity of over 8000 bricks per hour. Two parallel shafts carrying pug knives work clay, pass it into vacuum chamber with auger cylinders where it is finished and discharged.

Motor Ratings	1/2 to 400 H.P. All phases, voltages and frequencies.
Motor Types	Squirrel cage, slip ring, synchronous, repulsion-start induction, capacitor, direct current.
Construction	Open, enclosed, splashproof, fan-cooled, explosion-proof, special purpose.
Speeds	Single-speed, multi-speed, and variable speed.
Installation	Horizontal and vertical, with or without flanges and other features.
Power Drive Features	Electric brakes (2 types)—5 types of gear reduction up to 432 to 1 ratio. Mechanical and electronic variable speed units—fluid drives—every type of mounting.

tive officers of Sidney Machine will be J. H. Buhr, president, and W. R. Gerchow, executive vice president and general manager.

Budd Co., Philadelphia, purchased the Krouse Testing Machine Co., Columbus, Ohio, manufacturer of fatigue testing machines.

Sun Chemical Corp., Long Island City, N. Y., purchased Ansbacher-Siegle Corp., Staten Island, N. Y., pigment manufacturer. The acquisition is subject to approval by Sun's stockholders.

ASSOCIATIONS

Pressed Metal Institute, Cleveland, elected these officers: President, C. E. Stryker, Maysteel Products Inc., Milwaukee; first vice president, Carter Higgins, Worcester Pressed Steel Co., Worcester, Mass.; second vice president, D. W. Clay, Parish Pressed Steel Div., Dana Corp., Reading, Pa.; secretary-treasurer, Byrant Gemmill, American Stamping Co., Cleveland; and assistant secretary-treasurer, Mel Lorentz, HPL Mfg. Co., Cleveland.

Powder Metallurgy Parts Manufacturers Association, Pittsburgh, elected these officers: President, K. M. Gleszer, Dixon Sintaloy Inc., Stamford, Conn.; first vice president, W. R. Toeplitz, Bound Brook Oil-Less Bearing Co., Bound Brook, N. J.; secretary-treasurer, G. L. Bachner, Yale & Towne Mfg. Co.'s Powdered Metal Products Div., Franklin Park, Ill.

NEW ADDRESSES

Lehigh Mfg. Co., Lancaster, Pa., is moving its condensing unit and compressor manufacturing facilities from that city to the company's Easton, Pa., plant. The move will be completed by Dec. 15.

Stauffer Chemical Co., New York, moved the general offices of its Consolidated Chemical Industries Div. to larger quarters at 6910 Fannin St., Houston, Tex.

(Please turn to Page 104)

Here's why Thermalastic insulation ends major cause of generator and motor failure

LARGE mica splittings have long been recognized as the most reliable coil insulation material, but for years it seemed impossible to find the RIGHT impregnant for the insulation tape.

Some were too brittle and others too plastic at high coil temperatures; none could withstand repeated expansion and contraction of the coil . . . and sooner or later, tape separation caused failures.

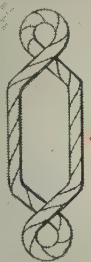

Then the great discovery — In 1949, Westinghouse research scientists made *Thermalastic*® insulation a reality by discovering the “miracle resins” which

cure to a *tough* resilient solid. Large mica splittings, overlapped like fish scales, are locked in this elastic bond which “breathes” . . . expands and contracts with the coil. It doesn't harden or soften with repeated heating by the coil. It doesn't deteriorate with age.

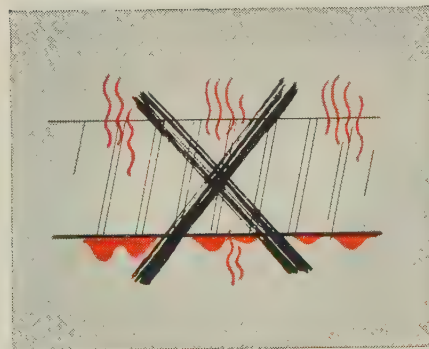

New color movie and bulletin show how and why Thermalastic insulation has extended the life of more than 40 million kva of generators and large motors. Contact your Westinghouse representative or write to Westinghouse Electric Corporation, P.O. Box 868, Pittsburgh 30, Pennsylvania.

J-15004

YOU CAN BE SURE...IF IT'S
Westinghouse

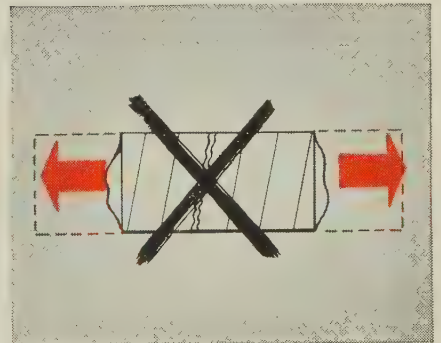

Atmospheric
Water
Weak acids
Alkalis
Oils, Solvents

Doesn't soften or embrittle

The patented resins in Thermalastic insulation are thermosetting . . . heat changes them from a liquid to a permanently elastic solid which doesn't soften or embrittle after repeated heating. And it doesn't deteriorate while in storage or in use.

Not stressed

The insulated coil is heated to operating temperature, and while it's expanded, the resins cure to an ELASTIC solid. That's why Thermalastic insulation is relaxed when the coil expands, compressed when it contracts. It flexes when the coil is overloaded.

Withstands attacks

which weaken and finally destroy other insulations. The Thermalastic insulation bond is void-free, has great density, and it's chemically inert. The physical strength of the resilient insulation wall is far greater than that of ordinary insulations.

BOLTS

(Concluded from Page 100)

Pacific Metals Co. Ltd. opened its new warehouse at 1900 Third St., San Francisco, Calif. The company bought the 193,000 sq-ft warehouse for \$1,250,000 and re-modeled it.

NEW OFFICES

Fairmont Aluminum Co., Fairmont, W. Va., producer of aluminum sheets, coils, and circles, opened a district office at 4200 Montgomery Rd., Cincinnati, Ohio. A. Joe Snider is district manager. The firm is a wholly owned subsidiary of Cerro de Pasco Corp., New York.

Summer & Co. is opening a scrap brokerage office at 2015 Highland Ave., Birmingham, Ala. R. A. Baker is manager.

Industrial Superintendence Inc. opened an office at 451 N. Cienega Blvd., Los Angeles, Cal. to offer international sales and supervision service to importers and exporters.

NEW PLANTS

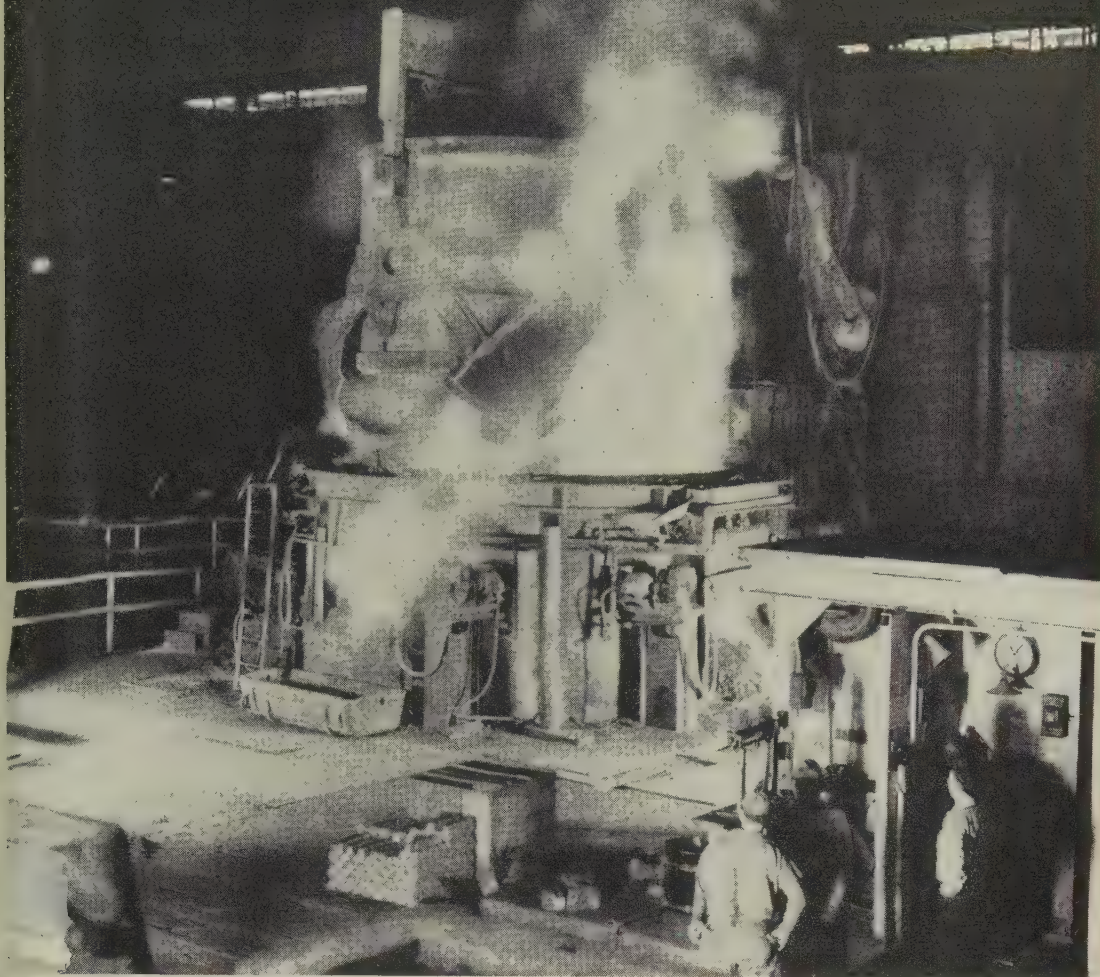

E. J. Lavino & Co., Philadelphia, will build a plant at Freeport, Tex., for the production of magnesite (periclase) from sea water. Output will be shipped to Lavino's refractory plant at Plymouth Meeting, Pa. The project (it'll cost about \$8 million) should be completed by mid-1959.

Controls Co. of America, Schiller Park, Ill., plans to build a 50,000 sq-ft plant at North Manchester, Ind., to house operations transferred from its facility at Spring Valley, Ill. Production of timers and switches for the home laundry industry is scheduled to start in January. The company also produces valves, thermostats, and other controls for home heating, commercial refrigeration, and automobile air conditioning equipment.

Gay Steel Fabricators, Dallas, is building a plant at Kaufman, Tex.

TRENDS IN METALS

Stainless Steels

THE aristocrat of metals, stainless steel, is as remarkable as the age in which we live. Its future is as secure as its present because it is as much at home in an atomic reactor or the launching platform for a missile as it is on your car or in your kitchen.

Strength, eye appeal, resistance to corrosion, resistance to high temperatures, and ease of cleaning give it its rare universality.

Users predict that more and more jobs will go to stainless (see Page 108). Trends in application (see Page 113), design, and fabrication (see Page 119) bear them out.

Not bad for a metal that was just being developed when Orville Wright made his historic flight at Kitty Hawk in 1903! Twenty years ago, stainless production was only a "drop in the bucket." In the last ten years, its production has doubled. Volumewise, a little more than 1 per cent of all steel produced is stainless. Dollarwise, its share of the market is much more impressive because it is our most expensive steel.

Its biggest user, motordom, took around one-sixth of all shipments last year. The 1958 Plymouth, for example, will sport an average of 22 lb per car. The 1958 Cadillac

will have 22.3 lb in its chassis, 13.7 lb in its body.

Within the last five years, the aircraft and missile industry has become the second largest user. It took about 8 per cent of the metal (\$75 million worth) in 1956. One producer is convinced the industry will become the top user (about \$200 million annually) in the next five years.

Boeing Airplane Co., Seattle, used about 1.9 million lb in 1956. Douglas Aircraft Co. Inc., Santa Monica, Calif., uses 2,740,000 lb a year in its own plants and 967,000 lb in its subcontractors' shops.

REPORT CONTINUED

PRODUCTION

Some 60 U. S. firms make mill stainless, helping to double production in a decade. About 50 grades are produced, but just 11 of them represent 85 per cent of the market

THREE SCORE companies in the U. S. make wrought (mill) forms of stainless. They and their products are listed below.

By far the largest tonnages come from the electric-arc furnace through the refining of scrap. Some specials are melted down from master alloys or selected scrap in crucible induction furnaces. A few alloys with extreme properties are made in consumable electrode or other vacuum furnaces.

Premium Product—The cost of ingredients going into stainless and the extreme care used in making

it help to account for its price. Another factor: Yield from a stainless ingot is low. Mills have to do a lot of conditioning of the semifinished steel and shearing of the finished product.

Distribution—Stainless is sold in smaller quantities than carbon steel, so a bigger percentage of the metal reaches the user via warehouses. (One-third is sold this way, versus only one-fifth for carbon steel.)

Cold-rolled strip accounts for one-third of all shipments, cold-rolled sheets one-fourth.

Ingredients—Chromium is the chief element that makes steel stainless. Nickel is added to boost up heat resistance and ductility and bring out other properties. Minute amounts of other elements help tailor the metal for specific jobs.

Chromium-nickel steels (austenitic) are known as the 300 series, chromium steels (martensitic and ferritic) as the 400 series and low chromium heat resisting steels as the 500 series (see Page 121). A 200 series has been added to cover chromium-nickel-manganese

*Production expected to start in 1958.

ganese grades which emerged during the nickel shortage after the Korean War.

Producers Are Busy—Stainless has amazing versatility, and producers are working to make it better. Here are the areas to watch:

1. Colored stainless: Mills can't make it with colors that compete with anodized aluminum. There's no conversion coating that will take dye. Blackening, porcelain enamel, organic coatings, and textured surface treatment are answers to colored anodizing.

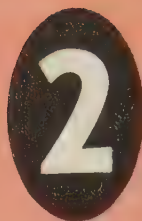

2. Wider, thinner, and flatter stainless: Users want coiled sheets 48 in. wide, hand mill sheets 72 in. wide, and Sendzimir strip 48 in. wide rolled to table-top flatness. More Sendzimir and other wide cold mills—with hot mills back of them—are being installed to meet width and tolerance demands, but table-top flatness is hard to get.

3. Stainless for extreme temperature use: Precipitation hardening types for service to 1000° F and new martensitic grades that retain their hardness to 1100° F are steps in the right direction. But mills don't like them; heat treatments are too tricky and too many heats have to be scrapped.

4. New mill finishes: The dairy industry wants mirror finishes. Architects want dull, nonreflective finishes. The auto industry wants textured and brushed finishes. Mills are meeting these demands.

5. New clads: The stainless-carbon sandwich has done well; a stainless-copper sandwich is growing in popularity; and a stainless-aluminum sandwich is in the offing. The big market potential is in cookware and heat exchanger tubing.

6. Cheaper stainless: Users want stainless that commands a good scrap price. That means lots of nickel, little manganese, few tramp elements. Mills plan to embark on a strong program of consumer education, calculated to create a demand for more stainless in places where lower-priced grades like 410 and 202 can be used. Bigger volume would mean lower mill costs and lower prices.

SURVEY

Almost half the respondents in STEEL's survey use the bright metal. Nonusers complain about cost, but some of them will switch to stainless next year

TO FIND OUT what stainless users are doing today and planning for tomorrow, STEEL surveyed 2496 metalworking plants employing 20 or more persons.

Returns show that 45.8 per cent use the bright metal, 54.2 per cent do not.

Distribution—More than 85 per cent of the users fall into these major industrial classifications: Transportation and fabricated metal products (except ordnance and machinery), 39 per cent; machinery (except electrical), 37.5 per cent; electrical machinery, equipment, and supplies, 10 per cent.

The complete rundown includes: Instruments—professional, scientific, and controlling (5.5 per cent); miscellaneous manufacturing industries (4 per cent); primary metal industries (2.5 per cent); furniture and fixtures (1.5 per cent).

Next Decade—A substantial majority (68 per cent) expects to use larger quantities of stainless over the next ten years (see opposite page).

Grades—Of the 26 types of stainless used by respondents, these were mentioned most frequently: 302 (used by 35.5 per cent); 304 (33.5 per cent); 303 (24 per cent); 430 (22 per cent); 316 (14.2 per cent); and 416 (14 per cent).

Quantities—More than one-third handle 1 to 5 tons annually. Here is a percentage breakdown, showing the distribution of users by tonnage categories and their estimates for 1958:

	1956*	1957	1958
	%	%	%
1 ton	14.5	11.0	8.5
1-5	32.5	35.0	33.5
6-10	14.5	10.5	11.0
11-19	6.5	11.5	8.5
20-49	10.0	10.0	12.5
50-99	8.0	12.5	12.0
100-249	6.0	5.5	8.0
250-499	2.5	1.5	3.5
500-999	1.0	1.0	2.0

*3 per cent of current users did not use stainless in 1956.

Less than 2 per cent of the firms have requirements exceeding 1000 tons a year.

Imports Hurt—Explaining why his firm will use

68% Plan To Use More

While respondents to STEEL's survey predict increases of 5 to 500 per cent in the next ten years, about one-third forecast gains up to 25 per cent. Most respondents favor either 10 or 20 per cent. Some 29 per cent expect to maintain their present level of consumption. Only 3 per cent say they'll use less.

68%
EXPECT TO
INCREASE
USE OF
STAINLESS

63%
MENTION
COST AS
BIGGEST
PROBLEM

63% Say Cost Is Barrier

One-fifth of the survey respondents say formability characteristics of stainless are a problem, as far as using it in their product is concerned. Some 8 per cent want improved tolerances; 8 per cent want better surface finish. Only one firm in 100 complains about inadequate gage.

24% Want Better Workability and Deliveries

Note that four of the seven suggestions by survey respondents for boosting stainless consumption have nothing to do with technical improvements. The four involve the marketing of the metal.

less stainless this year than last, a Connecticut flatware manufacturer cites the problem of Japanese competition. From a Massachusetts firm in the same business there's a similar report: "We can't use more stainless because of 19-cent-an-hour Japanese labor."

Users Speak—Asked to list the metal's principal shortcomings, 63 per cent of the firms mentioned cost (see Page 111).

Other complaints: "Cutting tools won't hold an edge; pits develop in stainless blades; no two companies making the same grade have the same machinability; stainless cannot hold heat (300 to 330° F) in application as a pressing surface with a radius." Says a Cleveland chemical manufacturer: "Because of the extensive corrosion in our plant, we look forward to the day when stainless will be completely stainless."

In defense, Joseph A. Lombard, design engineer for Harrigan & Reid Co., Detroit, stated: "My life is dedicated to the use of stainless steel. It has its limitations, just like diamonds and gold, but those who are quick in listing shortcomings probably know little or a lot about it."

Producers Can Help—Stainless users believe producers and distributors can make the metal more useful, primarily by better workability and improved deliveries (see preceding page).

One firm suggests that producers "provide better finishes." Another asks that they "provide shipments from one heat rather than from six or seven."

Reasons for Nonuse—For a third of the companies not using stainless, cost seems to be the principal objection. "From a competitive standpoint," says a pulley manufacturer, "we would be out of business overnight." A toymaker (electric trains) says he has no need for stainless competitively. A manufacturer of steel housewares argues "competition won't permit it."

Other reasons given for nonuse: "It's not specified by customers" (30 per cent gave that explanation); "it has no application to products we make" (24 per cent); "it's not practical" (4 per cent); "there's no demand for it" (1 per cent).

Taking issue with those who complain about the bright metal's cost, Mr. Lombard declares: "It is not expensive. It is either unnecessary or necessary. If necessary, it is not expensive."

Competitive Materials—Most frequently mentioned as competitors were aluminum, carbon steels, cold-rolled strip, plated steels, galvanized sheets, copper, brass, Monel, and hot-rolled plates.

Next year, 1 per cent of the nonusers surveyed will take the plunge. Half will continue as nonusers, and 49 per cent (mostly job shops) make no predictions.

Respondents Are Using Stainless Steel in These Products

TRENDS IN AUTO TRIM—Some aluminum trim items are switching to stainless. Nearly half the 1958 cars will have stainless wheel covers. Some stainless trim, such as the rear quarter panel on the Cadillac, will switch to aluminum in 1958

3

APPLICATION

The amazing versatility of stainless makes it valuable for many uses. Over-all picture is one of growing application. Here are reports by industry

AUTOMOTIVE

ALTHOUGH the auto industry is the largest single user of stainless, its consumption varies from car to car and year to year, depending on styling trends and costs.

Competition—Stainless competes directly with zinc diecastings and aluminum in most applications. It also fights chrome plated steel—bumpers and quarter panel trim, for example.

In the last five years, stainless

has lost out to aluminum in grilles. Ford and Chrysler have switched almost entirely to them.

Trim Trend—A few years ago, the industry went all-out for aluminum wheel covers. But car owners soon found they dented easily. The finish turned dull and spotty. In 1958, almost half the cars will switch back to stainless steel wheel covers.

Four or five years ago, the alu-

of the chromium-nickel austenitic types. A simple aging treatment should harden it to strengths given by tempered martensite structures.

RAILROADS

From 1952 through 1956 nearly 40 per cent of the passenger cars delivered by the nation's top four builders had stainless bodies. Twenty per cent used stainless exterior sheathing.

The big builder of stainless cars is Budd Co., Philadelphia. It has been using the material since the early thirties. Several cars built in 1934 are still operating—and have all their original stainless structural parts.

Other Builders — Other major builders are beginning to use stainless. Pullman-Standard Car Mfg. Co., Chicago, is using it for such parts as girder sheets and side sills which are subject to severe attack from corrosion. Both Pullman-Standard and American Car & Foundry Div. of ACF Industries Inc., New York, have used it for exterior sheathing.

Use in transit cars (subway and surface) is nominal, but the market has enormous potential. Weight savings made possible by the high tensile strength of stainless can mean big power savings.

Grade—Type 201 is the big tonnage item in the industry because Budd, which builds nearly all the stainless cars, uses it almost exclusively. It has the corrosion resistance necessary for railway applications, is easily formed by drawbench and brakes, and costs slightly less than the 300 series. Pullman-Standard says it is seriously considering high manganese, high chromium austenitic grades.

Types 201 and 202 are used for structural and trim parts. Where severe forming is necessary, Types 302 or 304 get the nod because of their better ductility in the annealed condition.

Tank Cars—The trend here is away from stainless because of its high cost. Many new coatings which resist the corrosive effects of chemicals and petroleum products carried in tank cars have been developed. When coatings won't do the job, Types 304, 316, and 430 solid and clad stainless are usually specified.

Stainless in Railway Passenger Cars

	(Number of cars delivered)			
	American Car & Foundry Div.	Budd Co.	Pullman- Standard Car Mfg. Co.	St. Louis Car Co.
1956	35	159	227	376*
1955	72	202	193	16
	170*			288*
1954	83	181	308	230*
	30*			
1953	26	173	62	130
1952	4	75	27	30
	Some stainless used.	All cars made of stainless.	Some stainless used.	Carbon steel only.

*Subway-elevated cars.

Some covered hopper cars have been made of clad 316 to carry such products as dry chemicals and flour. Contamination of the product is the chief problem.

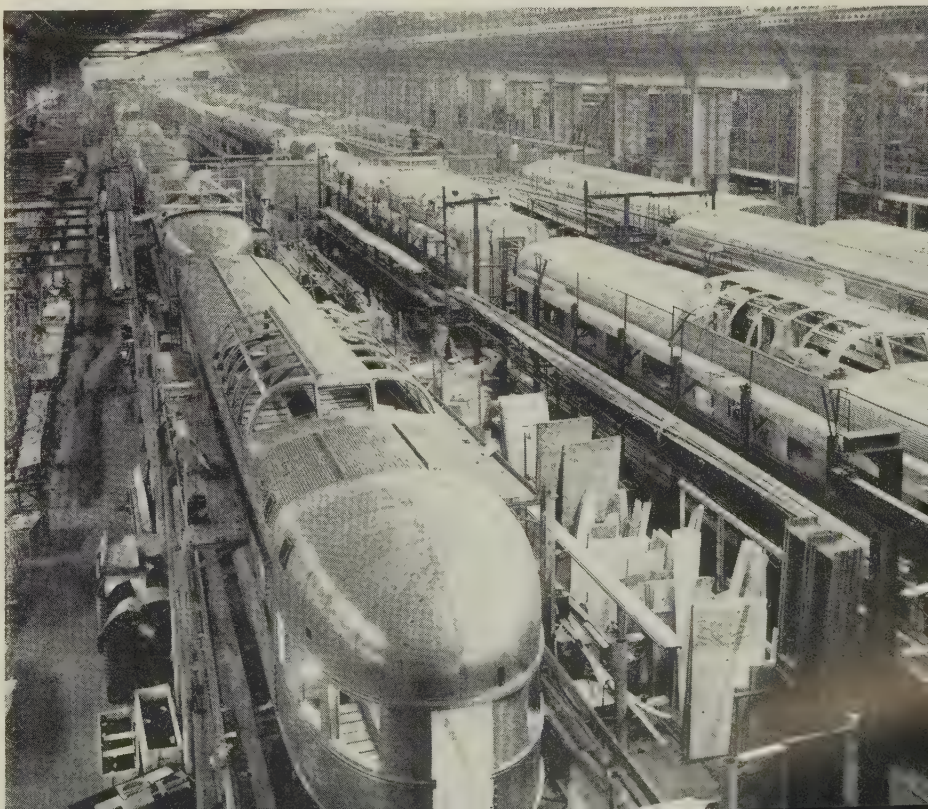

APPLIANCES

Stainless finds its major use in the home as appliance and furniture trim and in kitchen sinks. As a

volume market, sinks are most promising.

Hotpoint Co., Chicago, uses some stainless trim, principally on doors of some high priced refrigerators. The top of GE's kitchen unit—sink, dishwasher, washer, and dryer—is stainless. Norge Div., Borg-Warner Corp., seems to prefer chrome plate. Small appliance makers, like Cory, put out some

ON THE RAILS—The cars that come out of the Budd Co.'s Philadelphia plant are practically all stainless. It's the biggest application for the 200 series. Other builders are using more stainless in their cars

THE LUXURY MARKET—Stainless is competing with silver plate and sterling in such items as this serving platter, gravy boat and tray, and bread tray

STAINLESS STEEL

stainless products, such as coffee-makers, but they're luxury items.

Sinks—The stainless type accounts for about 8 to 10 per cent of all kitchen sinks produced. They are competitive with some of the higher priced conventional sinks. Improved manufacturing techniques and the trend toward lighter gages helped keep the price down. Most common grades used: 18 and 20 gage 302 and 430.

Washer, Dryer—Speed Queen, Ripon, Wis., recently introduced a washer with a stainless tub and a dryer with a stainless drum. Housewife acceptance may influence future use of stainless as a major component.

Stainless has a lot of advantages in the home, but the housewife will probably resist too much of it to

avoid the hospital or restaurant atmosphere.

UTENSILS

Cookware and flatware applications represent growing uses. The luxury gift trade is a promising new market.

Hollow trays, platters, and serving dishes have joined the kitchen parade of stainless pots and pans, knives, forks, and spoons, skillets, griddles, bowls, kettles, and other utensils. Stove-to-table casseroles are gaining popularity.

Types—Standard 18-8 chrome-nickel grades are used in most cases for their ease of forming and cleaning. Type 302 is used in greatest volume. Type 202 often replaces 18-8 when price is important.

Producers use Types 410, 420, and 440C for cutlery. Type 304 is used for special deep drawing ap-

plications. Types 430 and 301 also find cookware applications.

Laminates—Utensil producers are beginning to use a laminate with a layer of copper between two layers of stainless.

An aluminum company has been experimenting with aluminum between two sheets of stainless. The laminate is lighter and costs less, but bonding is a problem.

FOOD PROCESSING

Modern equipment in the food processing and dairy industries has been made possible by stainless steel, particularly the 18-8 grades.

Refrigerated milk dispensers are the newest use. They are being installed in school cafeterias, restaurants, and other eating places. Scaled down for the home, they will free refrigerator space for other uses.

It is practice to use stainless whenever metal and food are in contact. The material will not contaminate food, or impart flavor, and it looks sanitary.

Type 304 is used in greatest volume, although equipment makers specify significant amounts of 302, 303, and 316. They go into such things as cookers, kettles, vats, vacuum pans, evaporators, heaters, coolers, and juice processors.

HOSPITAL

Hospital equipment is nearly 100 per cent stainless. Ease of cleaning is probably the strongest point. But appearance and resistance to corrosion by chemicals and body fluids are also important. Cost is less an obstacle than it used to be.

One of the newest uses is in medical carts where the less expensive stainless-clad steel can be used. Instrument manufacturers are producing surgical blades from stainless. Many hospitals are going to stainless ultrasonic equipment for cleaning instruments.

BUILDING

The 45-story Socony Mobil Bldg., New York, is a dramatic example of stainless in architecture. Smaller uses, such as building fronts and first floor units, account for the bulk of the tonnage and hold the greatest promise.

Several stainless office buildings are going up, and more are planned. Examples: Union Carbide Corp.'s 50-story headquarters in New York will have a stainless exterior; the 10-story Columbus & Southern Ohio Electric Co. building in Columbus, Ohio, will use 110,000 lb; the Inland Steel and Morton Salt buildings in Chicago will be of curtain wall construction. (The 5-story Morton building will use 320 stainless panels.)

Growth Area—The material is finding increasing use in building fronts, counters, window frames, screens, columns, doors, trim, pipes, wall decorations, railings, sash, jambs, and transoms. It's being used decoratively and functionally. Other uses range from church spires and building domes to telephone booths and signs.

Many miscellaneous construction applications are growing. Manufacturers of ducts used in building air conditioning systems report a swing toward the metal, so do roof and window flashing fabricators. Hardwaremakers are using more of it for hinges, flat springs, runners, and tracks.

Future—Penetration of present markets is the key to the metal's future. More economical designs must be developed to utilize its mechanical and physical properties.

PETROLEUM

Type 304 solid and clad plates have been specified for a giant grease mixer being fabricated for a leading oil company. It is the industry's newest use of stainless. About 10 ft high, it will hold 22,500 lb per batch.

Refiners are interested in the material only when its corrosion resistance and temperature-strength qualities make it economically desirable. (It's being used in the mixer because some grease additives are corrosive at this stage.)

Refiners are in the catalytic reformer building phase of the octane race. It could precipitate the biggest near-term growth of stainless in the industry. The building of units for superfractionation and extraction is expected to be the next phase.

On the Fence—If refiners turn to high pressure equipment for superfractionation, little stainless will

be needed. Low pressure equipment would make the metal desirable because of its good strength at low temperature.

Other uses will grow as the industry expands. Refinery vessels and furnace parts represent the biggest use. When corrosion is a factor, vessels often are lined to provide 20-year service. Another major use is for heat exchangers.

TEXTILE

The surface smoothness and corrosion resistance of stainless make it ideal for much textile processing equipment. It finds its greatest use in the wet processes—dyeing and addition of materials from water solution to improve the feel, drape, and stiffness of cloth.

Cloth is continually moved over the surface of treating tubs or tanks; surface smoothness is necessary to reduce wear. It also makes it easier to clean the tanks.

CHEMICAL

The application of many chemical processes has been made possible by the development of stainless grades for them.

An example of this is Carpenter Steel Co.'s No. 20 grade. It was developed specifically to resist sulfuric acid. Type 316 is gaining wide acceptance in hazardous applications. The molybdenum modified grade is being used for valves, pumps, and other working parts in direct contact with chemicals.

Castings and bar stock covering a broad range of specifications are going into solenoid valves used for automatic or remote control, measuring and weighing liquids, emergency shutoff, discharging weigh tanks, and drum filling.

Heavy wall seamless cylinders (containers to hold gases and chemicals under pressures up to 10,000 psi) are being produced in larger volume.

PAPER MILLS

Use has been increasing steadily in this industry, and it will continue to do so. Example: Riegel Paper Corp.'s stock preparation equipment at its new paper mill (Acme, N. C.) is made entirely of Type 316 or lined with stainless. It was built by Black-Clawson Co.'s Shartle Div., Middletown, Ohio.

The large castings and forgings

MILK ON TAP—New use in restaurants is a bulk milk dispenser. The refrigerated units are being developed in smaller sizes for the home

Joseph T. Ryerson & Son Inc.

FUNCTIONAL BEAUTY—Sandwich walls made of galvanized carbon steel sheets, insulation board, and stainless sheets have insulating value equal to that of an 8 in. brick wall. Construction has been used in two big industrial buildings

STAINLESS STEEL

used in papermaking machinery are mainly Types 316 and 304. When extra hardness is required, as on roll coverings, Type 420 is often used.

Newer applications in papermaking machines include: Coverings on the press and suction rolls, and the large dryer rolls.

Stainless cladding has gained some acceptance as a lining in large digesters in pulp mills. Another factor stimulating demand is the increased use of neutral sulfite semichemical pulping.

LAUNDRY

Practically all commercial washing and dry cleaning machines are made of stainless. Some 1935 model washers are still in operation.

The wood, cast iron, and brass

construction of early machines would not permit the use of today's improved cleaning materials. Monel made its debut in the early thirties. It was discarded when stainless came along because it was easier to fabricate.

Some new machines can handle up to 1000 lb of dry clothes.

ATOMIC ENERGY

Here is a growing market for stainless. Reactors and atomic powered machines require its high temperature and corrosion resistance. Nonmagnetic characteristics also can be valuable.

Instruments, measuring, and recording devices are taking substantial amounts, as are chemical plants and laboratories doing atomic work. More will be needed.

Boron Stainless—Modified compositions are being developed to bring out special nuclear proper-

ties. Boron additions give properties useful in moderating and shielding the flow of neutrons.

Type 304 containing 1 per cent boron is being used as thermal shield in reactors; 304 with 2 per cent boron is used for control rods.

Marine Uses—In initial work on water-cooled reactors of the type used in the *Nautilus*, 347 was generally chosen as the main material of construction. It offered the maximum degree of corrosion resistance for the environment.

As the project progressed, tests showed that an unstabilized grade such as 304 could be used in many places without danger of intergranular corrosion.

Weldability Important — Types 304, 316, and 347 are being used to fabricate pumps and valves. Selection often hinges on welding characteristics. Type 316, which is better stabilized than 304 and presents less difficulty than 347 is generally described as a "middle of the road" choice. It is being favored in some installations.

One large producer of canned pumps uses 304 stainless welded with 308 rods. Companies building commercial equipment for atomic energy lean toward 304 because it is cheaper.

Future — Users want adequate corrosion resistance, plus a higher yield strength than 304 offers. Endurance limit is also important; structural members may be subjected to many thermal cyclings.

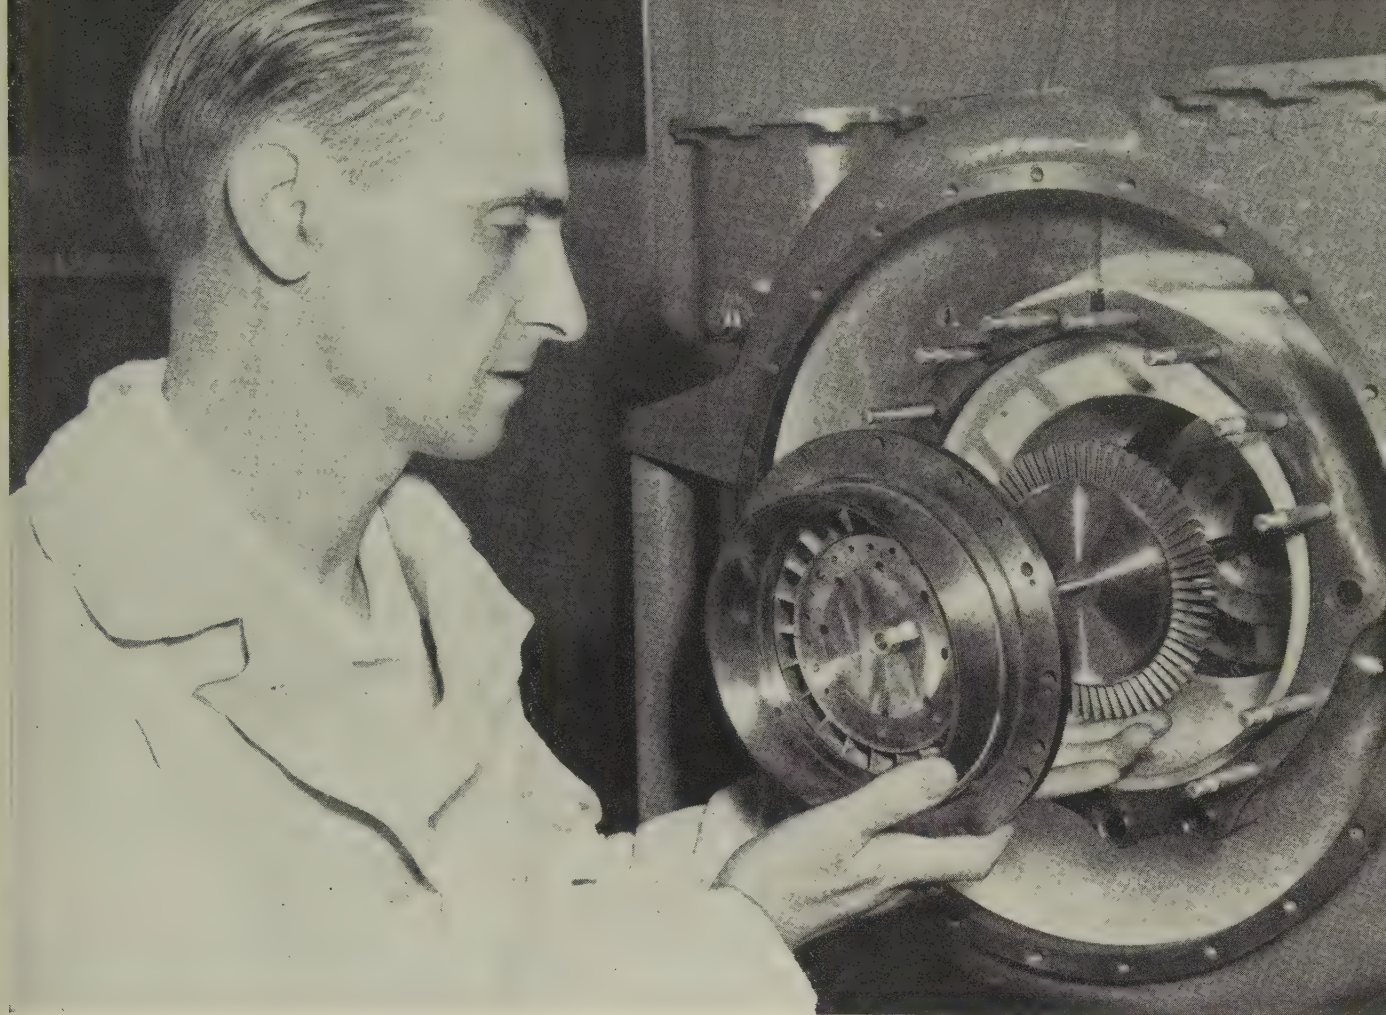

FASTENERS

The use of stainless fasteners is growing. Corrosion resistance, strength, and heat resistance are top considerations.

Applications—The electronics industry is probably the largest single market. Automotive, appliance, and building applications appear to have the greatest potential for immediate development.

Other important applications: Electrical, aircraft, railroad, chemical, food processing, petroleum, pulp and paper, dairy equipment, store and soda fountain equipment, kitchen, and refrigeration.

Most grades are involved. When stainless parts are joined, fasteners of the same type are generally used, making for uniform corrosion resistance and appearance.

METAL FOR HEAT—Chrysler Corp. uses stainless for the nozzle ring and the turbine wheel disc in one model of its experimental gas turbine engine. The stainless can withstand the 1500° F created in the engine's combustion chamber

4

FABRICATION

Users of stainless can choose grades for drawing, machining, welding, and other fabrication processes. Extrusion and stretch forming are gaining acceptance

THE designer should be familiar with the whole family of stainless steels. Intelligent selection can pay off in design improvements and cost savings.

The table on Page 121 lists the 39 standard AISI types. A number of other alloys are available under various trade designations. Many were developed to accent some special properties which the designer may need.

Types—As shown in the table, the AISI types fall into three basic groups: 1. Martensitic. 2. Ferritic. 3. Austenitic. They offer a range of mechanical properties.

For example, the austenitic steels have the best impact properties at low temperatures and best strength at elevated temperatures. Martensitic steels have the highest hardness at room temperature, and a wide range of mechanical

properties may be obtained by heat treating.

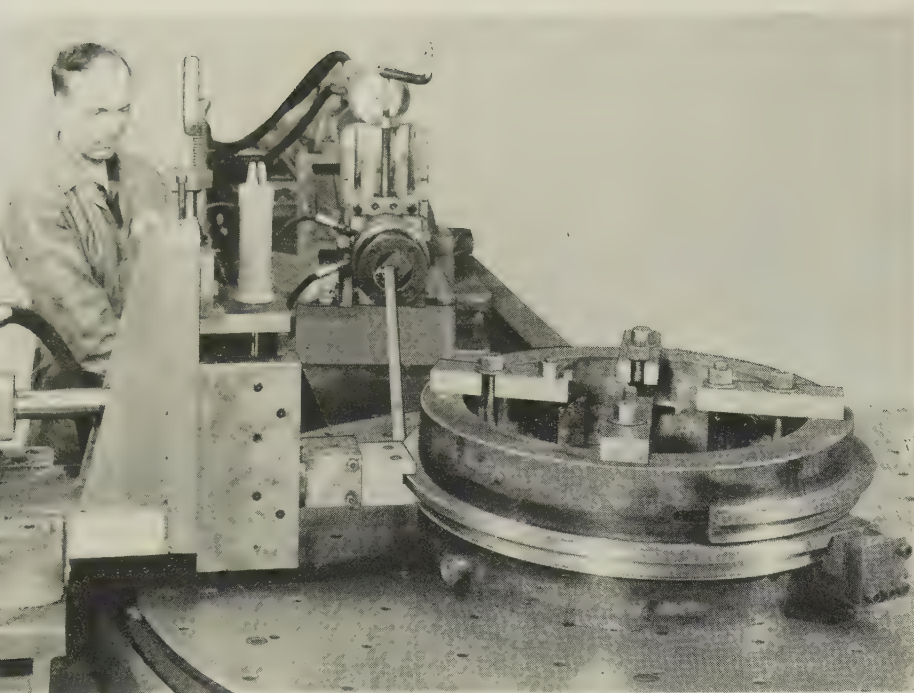

Type 410 is the most widely used of the martensitic grades. Types 420 and 440 are used where greater hardness is needed.

The higher chromium content of ferritic, Type 430 gives it better corrosion resistance than the martensitic grades.

The austenitic types (302 is the most popular) have excellent corrosion resistance. Their austenitic structure gives them good ductility.

The new chromium-nickel-manganese grades 201 and 202 are austenitic types with much lower nickel content.

Corrosion Properties—Generally,

Cyril Bath Co.

STRETCHING TO SHAPE—Automakers are turning to stretch or wipe forming for shaping many stainless parts. They find it's cheaper than press forming, overcomes a large part of inherent springback, and reduces time for changeovers

corrosion resistance varies with the percentage chromium in the alloy. The 18-8s have grown to be a sort of a standard for comparison. They have ample reserve margins of resistance to weather, kitchen, laundry, dairy, and general use.

Type 430 is used almost interchangeably with the 18-8s for many applications. It's highly corrosion resistant, though not to the same degree.

Corrosion resistance of the newer 200 series is in general similar to that of 301 and 302. In most media, it has proved superior to the 400 series. For many applications, it is equal to the 300 series.

Reasons — The designer may choose stainless to meet either functional or decorative needs. The technical reasons for his choice may be found in mechanical, corrosion, or heat resistance requirements of the product.

An equally valid choice may be based on sales appeal. Stainless is a glamour metal. When used as trim it may add little or nothing to a product's function but will do a lot to sell it in competition.

FABRICATION

Many fabricators are turning to stretch or wipe forming. It's

cheaper than conventional draw or press forming, and the method overcomes a large part of the material's inherent springback. Other advantages: Simplicity (it reduces downtime for changeovers), low first cost, and versatility.

Automakers are foremost in the move. Ford Motor Co.'s new plant at Sandusky, Ohio, uses several experimental machines made by W. A. Stevens Co., Vidalia, Ga., to form interior and exterior trim. Chrysler Corp., Detroit, has several radial draw formers made by Cyril Bath Co., Cleveland.

Aircraft Trends—The honeycomb sandwich is the outstanding new fabrication method in the aircraft industry. Sendzimir-rolled sheets are being bonded to stainless cores to produce light, strong panels (see STEEL, Oct. 14, p. 116).

Larger forgings and thin-walled extrusions with close tolerances are becoming necessary in today's hot aircraft.

Explosion Forming—This area is getting a lot of attention from researchers. It has many possibilities: 1. Much lower die costs. (The method uses only half a die or none at all.) 2. Deeper formed parts. 3. Higher quality parts. (Early results show more evenly distributed stresses.)

The same method is being tried for extrusions. A billet is fired through a die instead of being pushed hydraulically. Designers point out that extremely thin-walled parts can be made.

Finishing—An important quality in many applications is the ability of stainless to take and hold polishes.

Two avenues to cost savings are frequently used by fabricators: Protective coatings for mill finishes and coated abrasive belts for shop applications.

Finishing by such methods as scratch brushing and abrasive belts hides most fabricating marks. For severe handling and forming, many firms are using stainless with heavy paper or abrasion-resistant plastic coverings.

Shop Methods — Abrasive belts are fast becoming the most widely used shop finishing medium. In addition to hand grinders, there are many new automatic finishing machines for flat and slightly contoured sheets.

Electropolishing is maintaining favor for more intricate parts or those with inaccessible interiors. Some nameplates are deep etched and the grooves filled with paint. Fabricators like the better bond stainless provides for the paint—undersurface corrosion is a widespread cause of peeling.

Fresh Effects—Stylists are continually trying new methods for fresh effects. Translucent porcelain enamels are exceptionally attractive. A number of novel effects have been made by combining them with deeply textured surfaces.

Black etching is widely used for nameplates. Some vending machine makers are etching trademarks directly on cabinet bodies by this process.

Welding—Nearly all fabricators agree that the trend in welding is to automatic methods. Colonial Iron Works Co., Cleveland, explains: "We feel that refinement of fluxes is responsible for the new emphasis. New types maintain correct chrome and nickel concentrations in the weld nugget. Where possible, we use automatic submerged arc welding to join all stainless thicker than 1/16 in."

George Parks, chief welding engineer, Solar Aircraft Co., Des

Moines, Iowa, says that aircraft fabricators also concentrate on finely controlled automatic systems (Mig or Tig). Welds are shielded with helium or argon.

Metal Selection—Carbide precipitation and underbead cracking are problems. Users have a choice of stainless grades that will minimize the hazards: ELC (extra low carbon), columbium, or titanium stabilized grades.

ELC grades give better results for high temperature and corrosive applications when subsequent heat treatment isn't used. Columbium and titanium stabilized grades are used although they require some modification of welding method to overcome crack (notch) sensitivity.

New Method—One welding electrode manufacturer has followed the submerged arc trend with a new method for depositing stainless on base plates of mild or low alloy steel. Two wires are fed continuously in an automatic machine. Alternating current passing between the wires melts the stainless and deposits a wide, heavy bead. The arc is submerged in a granular flux.

The firm says dilution and penetration are kept at a minimum. The method was used on the new atomic reactor vessel at Shippingport, Pa.

MACHINING

Most production men who machine stainless don't work from handbooks, particularly when it comes to speeds.

As E. F. Allred, process engineer, Diversey Engineering Co., a Chicago maker of missile parts, puts it: "The drive to make money soon crowds you away from safe but conservative lower speeds. You learn that with some tool modifications, you can get high speeds and high production rates. From there on it's a matter of refinement."

Starting Point—Here's how he would advise the beginning user: "On one of the tougher alloys, say 347, I'd say begin at about 350 sfpm with a 3/8-in. cut and a 0.025-in. feed. Work up from there."

His starting point is about double what most books suggest. He emphasizes (as do all other users) that there are two musts: Ade-

* At producer's option; reported only when intentionally added.

quate machine horsepower and absolute rigidity of machine, tooling, and workpiece.

"If you don't have them, you're out of contention in the contract business."

Here's how you can cut stainless at practical, competitive rates.

• **Turning** — Authorities recommend a lead angle on the tool, unless you're turning to a shoulder. Throwaways, with their negative

STAINLESS STEEL

rakes, will work if you boost speeds. Use big tool shanks to get rigidity. Leave at least 0.005 in. of stock for finish cuts.

- **Drilling**—There's a trend toward sharper drill points (one plant uses 90 degrees) with grooves or notches in the cutting edges that will break the chips. Use fairly high feeds to keep the drill from rubbing.

- **Milling** — The trend is toward carbides, except for form cutters where cost would be prohibitive. Flood coolant in from behind the cutters to keep the work area submerged.

- **Tapping**—Use a high hook angle. Most production men prefer the two flute, gun type taps. Try a mixture of white lead and sulfur-base oil for a lubricant.

- **Free Machining Alloys** — The most common ones contain sulfur or selenium. Leaded stainless aims at the same target. Ease of machining is about equal to that of common alloys. Machining experts have few problems with them.

FORGING

Use of large stainless forgings is on the increase. They require less material than several small ones needed to do the same job, and they reduce machining.

Many are going into aircraft. Rings with a 20 to 30 in. OD and a total tolerance of $\frac{3}{8}$ in. are being made. Forgings are being used extensively for jet engine compressor sections, wheels, blades, and stator vanes.

Civilian Uses — The trend to higher temperatures and pressures in process equipment is causing a switch from stainless to higher alloy materials on some jobs. Others are being upgraded to stainless. Net result: There seems to be no decrease in demand for forgings.

Forgings find wide use in oil fields, chemical industries, coal fields, sewage plants, and other areas where temperature, corrosive conditions, and strength requirements make their use economical. A potential market: Coal hydrogenation plants.

More 201 and 202 are being specified where optimum corrosion re-

sistance is not a factor. Reason: Lower cost.

CASTING

Precision casting methods are growing in importance.

Shell molding is being used more, says the Alloy Casting Institute. High volume parts like valves and fittings lend themselves to the process. Shell molding of light work comes to 10-25 per cent of output at Cooper Alloy Corp., Hillside, N. J. Corerom work using the CO₂ process has reached 50 per cent.

New Processes—Ceramic mold processes are being investigated by many producers. R. W. de Weese, vice president, sales, Electric Steel Foundry Co., Portland, Oreg., explains: "This process offers substantial promise in the production of castings that will have the quality and surface finish acceptable to the aircraft and guided missile fields."

Another new development is the use of hot, or exothermic, sleeves for open risers. Jobs that could not be done can now be produced practically and economically, says Cooper Alloy.

New Alloys—New casting alloys have been developed to answer the need for higher strength and resistance to corrosion. One is CD-4MCu, which can be precipitation hardened at 800 to 900° F (see STEEL, Jan. 28, p. 95).

The 17-4 PH grade is being cast in both shell and sand molds. The precipitation hardening alloys are being used by valve and pump makers to eliminate galling, reports H. L. McClees, president of Crucible Steel Casting Co., Lansdowne, Pa. Precipitation hardening increases tensile and yield strengths without destroying corrosion resistance.

New Uses—Cast fittings and valves are being used by the nuclear industry as primary loop components in pressurized water reactor systems for 2500 psi service at 670° F, says Cooper Alloy. The firm has introduced a line of Type 304 stainless castings that meets the AEC's standards for x-ray and dye penetrant tests and the 20-minute hydrostatic test at 6000 psi.

The Alloy Casting Institute sees

increasing use of stainless castings in nuclear reactors. It's indicative of a general trend toward higher processing temperatures and pressures. In power generation, steam turbines are being run at 1600 to 1800° F.

Up and Down—John McBroom, president of Stainless Foundry & Engineering Inc., Milwaukee, says: "We have noticed a trend toward what may be referred to as super-stainless steels. We get more inquiries for these higher alloyed metals."

Also: "Low temperature properties (for around - 270° F) are requested more frequently."

And Around—Sandusky Foundry & Machine Co., Sandusky, Ohio, a centrifugal casting specialist, sees a new use for stainless in suction press rolls for papermaking machines. Also new: Snorkle tubes and radar masts, control mechanism parts for atomic reactors, catalyst baskets for chemical plants, and stator shells for canned motor pumps used with atomic reactors.

A new application for ferritic stainless is in shell molded wear plates for large automotive dies.

METAL POWDER PARTS

Producers of stainless powders run into two sales problems: Fabricators must have a sintering furnace in the 2100 to 2300° F range, and few designers know about the availability of the material.

Keystone Carbon Co., St. Marys, Pa., fabricates parts from Types 316 and 302B powders. Strengths range from 30,000 to 50,000 psi, with 5 to 10 per cent elongation. The parts are used in home appliances, sporting goods, and novelty items.

Other leading applications include filters, cams, bushings, water meter parts, bearing blocks, instrument parts, ordnance parts, and pressure snubbers.

Producers see greater use for molded structural parts and filters. As sintered parts approach 90 to 95 per cent of theoretical density, they show strength and ductility nearly equal to bar stock.

manufacturers of stainless steel fasteners

By systematic replacement of tin plate mill facilities, Wheeling Steel . . .

Keeps Output Up As It Rebuilds

BY "moving its equipment like men on a checkerboard," Wheeling Steel Corp. will be able to complete a \$30-million improvement program at its Yorkville (Ohio) tin plate mill with practically no loss of production.

Wheeling decided to expand and modernize the facility in September, 1955. It also wanted to speed product flow by eliminating cross-handling. The problem: To install new equipment and revamp production facilities without delay-

ing shipments to customers.

Careful Planning—"We planned our moves until March, 1956. Then we began a systematic renovation of the mill," explains G. A. Scheetz, general manager of the plant. Using plant diagrams, :

KEEPS OUTPUT UP . . .

priority system was established. Each improvement was made with little or no production loss.

Three groups of annealing furnaces were installed. The first group was put in place without interrupting annealing operations. Temporary furnaces replaced existing capacity when the second and third groups were installed. They were put in an area where annealed coils were stocked.

Wheeling plans to relocate furnaces and bases step by step. The portable units are sized to anneal 72 in. coils, with a maximum stack height of 168 in. Some 20 furnaces and 59 bases were purchased for the installation. Ten cooling covers were provided to speed up cooling of annealed stock.

Moving Job—In many cases, relocation of equipment was necessary before new units were installed. Example: To install a new, 5-stand tandem mill, motor generator sets for a mill had to be moved. The move was made during a weekend when the mill was not scheduled to operate.

In the few cases where production has been lost, Wheeling's flexibility of operations has proved valuable. Example: Pickling operations will be reduced for about seven weeks during the dismantling of a pickler. While a high speed, continuous pickler is being installed, Wheeling's nearby Steubenville, Ohio, plant will lend a hand.

New Equipment—When the program is completed (by the end of the first quarter of 1958), Yorkville will have a 48 in., 5-stand tandem mill to cold reduce hot strip. A new 5000-fpm temper mill will process wide strip in coils.

A modernized machine shop and a new roll shop are in operation. The increased demand for tin plate and black plate in coil form has brought about installation of a third side trimming and recoiling line. One of the two electrolytic tinning lines will be equipped with coilers to supply canmakers with electrolytic tin plate in coils. Wheeling will also install a new electrolytic cleaning and scrubbing line; two lines will be modernized.

A Conco engineered Crane is **top management's** idea of value. Quality like this means minimum maintenance cost; slow depreciation, tailored-to-the-job engineering, reduced accident hazards. Conco engineered Cranes reflect the more than 37 years experience that lies behind them. Write for bulletin 5000A covering the complete line of Conco cranes, hoists and trolleys.

In use, pressure is concentrated on center section of die

typical extrusion die

MEL-TROL

Until now, it's never been possible to look at an alloy bar or disc and be sure its center is as sound as its surface. Sometimes centerline weakness won't show even in a cross section. But it will show in rejects, breakage, rapid wear. The extrusion die illustrated is just one example.

High alloy or high carbon steel bars and discs made by conventional steelmaking practice are subject to poor toughness and erratic properties at the core. The cause is inhomogeneity—segregation, porosity, weakness—that occurs in the ingot while it is freezing.

Composition of the steel, purity, pouring temperature and ingot mold design all affect core quality. Core defects cannot be entirely eliminated by rolling and processing of mill shapes. They remain in the core of the

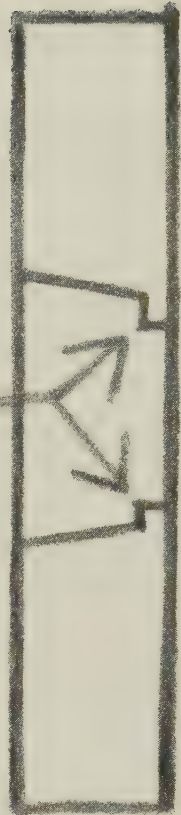

bar, and may vary from major defects such as internal cracks, porosity and center segregation to subtle differences in mechanical properties and service behavior between core and surface material which are virtually undetectable before machining or before a part fails in service.

The Mel-Trol process eliminates the problems of inhomogeneity by eliminating their causes.

Mel-Trol is an organized system of extra time, extra care, extra effort—perfecting the steelmaking process to its very greatest efficiency.

Quality control begins with scrap analysis, follows through the melt, casting the ingot, through rolling, annealing—all the mill processes that prepare Carpenter alloys for you—the user. Mel-Trol uses exclusive,

If bar from which die is made has any center porosity, segregation or weakness, die may break, because pressure is centered where these faults concentrate. That is why Mel-Trol alloys are proving superior to regular steels in this highly demanding application. Mel-Trol alloys are uniformly strong at core. Strength is always where it's needed because the Mel-Trol process virtually eliminates possibility of centerline weakness.

enlarged side view section

new metallurgical achievement that is producing uniformity never before available in specialty steels

Carpenter-developed quality control tools and procedures along with the most modern equipment commercially available.

Mel-Trol gets results because—every quality control tool and procedure used is used to its fullest capability—nothing less. A typical example: Fuel injection nozzles which are exhaustively tested after machining. When

the manufacturer switched to a Mel-Trol alloy, rejects dropped from an average of about 7 per 1,000 to only 2 in 90,000.

Ask the Carpenter representative who calls on you about Mel-Trol. A selection of superior tool and die steels and elevated temperature alloys produced by the Mel-Trol method is available now—from Carpenter.

Ford Sells the Building Block

The idea of standard dimensions for machine tools hasn't died. In fact, a Ford spokesman says, the concept is already through the first two of four necessary stages

THE DRIVE to standardized machine tools advocated by engineers at Ford Motor Co. is well under way, says a company spokesman.

At a recent closed meeting in the Pentagon, H. C. Daum, manager, machining process department in Ford's manufacturing engineering office, told Air Force officials the "building block" program will be brought about in four stages.

Two To Go—The first step is to stimulate interest among builders. "This we have done."

Next, general specifications for in-line transfer machines had to be published. "Our purchasing activity now attaches copies of such specifications to all quotation requests for such machines." (Ford's new Lima, Ohio, plant features machines bought with building blocks in mind.)

The third step, now in the works, entails development of more detailed specifications for "industry-wide standards for mounting patterns of the major components . . . required to construct nearly all production machine tools."

Finally . . . "We propose standardization of physical dimensions for spindle heights and mounting dimensions of manufacturers' power units. Such standardization will be developed in conjunction with machine tool builders."

Objection—At best, industry-wide transition to standardized dimensions will go slowly. The builder who likes to boast that his "hexagonal ways are flutter-free" is likely to be difficult to coax into camp.

Ford knows this. Mr. Daum says: "We would be the last people in the world to desire the freezing of machine tool design."

But he adds: "We are sure that the industry will be . . . responsive in meeting the changing

requirements which the future is bound to bring."

How To Sell

Should machine tools be sold through distributors or direct sales staffs?

The question, always a "hot potato," was discussed by a panel of machine tool builders at the annual meeting of the National Machine Tool Builders' Assn. at French Lick, Ind.

Advocates of direct sales staffs cite advantages of control, continuity, and concentration.

Walter K. Bailey, president, Warner & Swasey Co., Cleveland, put it this way: "We feel selling is a management problem and should not be delegated."

Frank Hayes, vice president, Bullard Co., Bridgeport, Conn., added that increased complexity of customer products calls for more complex sales engineering solutions that can best be handled by factory trained specialists.

K. M. Allen, executive vice president, Rockford Machine Tool Co., Rockford, Ill., pointed up an advantage in distributor selling. His company uses 38 distributors with 190 sales engineers. Assuming they spend only 20 per cent of their time on Rockford products, they are the equivalent of 28 full-time men, a force few small companies can afford.

A variation in distributor selling was brought out by Ralph J. Kraut, president, Giddings & Lewis Machine Tool Co., Fond du Lac, Wis. His company gets the coverage it wants by using distributors, but it retains control by having dealers work through five sales districts, each with a direct company sales staff.

Space Welding

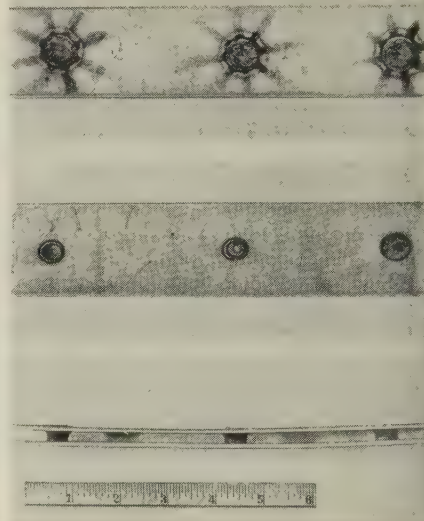

It's done with a portable spot weld gun. Nuggets are spacers. Assemblies are strong

THE method illustrated below is a new way to join two sheets with a gap between them, says the Linde Co., a division of Union Carbide Corp., New York.

Called space welding, it's said to be economical in the construction of heat exchangers and metal sandwiches.

Method—It's unlike projection or plug welding. No contact is required between sheets, and projections or holes for plugs are not necessary. Removable spacers separate sheets during welding.

The tool is a standard Sigma spotwelder, using argon shielding gas. Wire feed is delayed until the arc melts a hole in the top sheet and molten metal fuses with the lower one. Metal continues to build up until it fills the hole and fuses with the top sheet.

SPOTWELD METHOD

. . . joins spaced sheets economically

Strong — The assemblies are rigid. When two 1/16-in. carbon steel sheets are space welded, it takes a force of 412 lb to deflect them 1/2 in. A single 1/8-in. sheet can be deflected the same amount by a force of only 212 lb.

Space welded assemblies also have greater bursting strength than those made by projection or plug welding, says Linde, which makes the spotweld gun.

What's New in Metals

Those attending the National Metal Congress in Chicago this week will hear these subjects in technical sessions. Here is a cross section of ASM papers

Leaded Steels

Machinability of Type A Leaded Steels—There are subtle microscopic differences in lead or lead compound particles in high sulfur steels. The relative mass of the lead particles is affected by the rate of solidification of the parent ingot, association or lack of association with other nonmetallics, and the malleability of the sulfides.

The machining uniformity of Type A leaded steels is subject to the same chemical composition variables that affect the machinability of nonleaded, open hearth, free cutting steel.

Oval sulfide inclusions increase the machinability of leaded steels and stringerlike nonmetallics seem to decrease it.

The bulk of lead in the steels occurs as envelopes or sheaths associated with the sulfides. The mass of the lead tails is, to some extent, dependent on sulfide malleability. The machinability rating variations within Type A steels may be the result of a size effect, with both fine stringerlike sulfides and corresponding fine lead tails being unfavorable.

Because of the interdependence of sulfide and lead particle size, however, the size effect of in-

clusions is not considered to be conclusive.

Decreased carbon and silicon favor the formation of oval sulfide inclusions with correspondingly massive lead tails and are beneficial to the cutting quality of Type A stock. Machinability is increased by lower manganese contents.

Exclusive of inclusion variation, lead and sulfur appear to have a similar beneficial effect of about + 1 index point per 0.01 per cent increase of the element. Phosphorus and nitrogen do not appear to influence the quality of Type A steel.—E. J. Paliwoda, Jones & Laughlin Steel Corp., Pittsburgh.

Morphology and Chemistry of Lead in Leaded High Sulfur Steels—Microradiography is a useful tool for investigating the morphology of leaded steels, especially when used in combination with standard metallographic methods.

An experimental ingot of leaded, high sulfur steel was examined by microradiography in both the as-cast and hot-rolled conditions. It appears that virtually all the lead can be revealed by the technique.

The distribution of the lead in the as-cast ingot closely follows

that of other segregating elements, particularly sulfur. This is a result of mechanical processes occurring during freezing which force lead and nonmetallic inclusions (such as manganese sulfide) into the same interdendritic areas.

X-ray and electron diffraction tests show no evidence of lead compounds. The lead is present largely in the elemental form. The close association of lead with manganese sulfide apparently is not a result of chemical reaction or mutual solubility at elevated temperature.

The distribution of lead and the size of lead particles is a function of the time required for solidification in relation to the settling rate of lead particles.

Rolling elongates the manganese sulfide inclusions and at the same time forces the associated lead particles to each end of the inclusion where they exhibit the typical appearance of lead sheaths or "tails."—J. W. Thurman and E. J. Paliwoda, Jones & Laughlin Steel Corp., Pittsburgh; E. J. Duwell, Minnesota Mining & Mfg. Co., St. Paul.

Stainless Steels

Effect of Microstructure and Heat Treatment on the Mechanical Properties of Type 431 Stainless—Many critical applications in chemical equipment, aircraft, and ordnance require a material with high strength and good corrosion resistance.

Frequently, the strength requirement rules out austenitic and ferritic stainless steels and it is necessary to use one of the martensitic grades. AISI Type 431 (16 per cent Cr, 2 Ni), is one of the most potentially attractive steels in this class because it has the highest corrosion resistance of this series of alloys and mechanical properties equivalent to those of low-alloy steels with about the same carbon content.

However, a number of factors have restricted the widespread use of the material.

1. The rapid drop in hardness over a narrow temperature range makes it difficult to control the hardness by heat treatment.

2. The ductility in the trans-

WHAT'S NEW IN METALS . . .

verse direction of forgings is particularly poor at high strength levels.

3. Most commercially produced Type 431 stainless steel contains an appreciable amount of delta ferrite as a microconstituent.

Studies were made to determine the effect of microstructure and heat treatment. Four conclusions were reached:

1. The transverse reduction of area of Type 431 is considerably improved at high strength levels when the steel does not contain ferrite stringers. This should apply also to other hardenable stainless steels.

2. Fracture occurs in the ferrite stringers and results in high stress concentrations in the tempered-martensitic matrix.

3. The transverse ductility is also sensitive to the quenching temperature, reaching a low value in ferrite-free steel when the austenitizing temperature is one at which a grain-boundary precipitation of carbide occurs.

4. Retained austenite reduces the yield strength of this steel. This effect can be minimized by a refrigeration treatment.—G. E. Dieter, E. I. du Pont de Nemours & Co. Inc., Wilmington, Del.

Influence of Nickel on Intergranular Corrosion of 18 Per Cent Chromium Steels—Types 304 and 430 steels can be relatively immune to intergranular attack or made susceptible (sensitized) through selected heat treatments.

A specific heat treatment makes one steel immune and the other susceptible. Another specific heat treatment results in the reverse situation.

The question arises: At what nickel content does the "switch" occur? The purpose of this study was to determine where the division or transition in the mechanisms of intergranular corrosion occurs and also the heat treatments required for optimum corrosion resistance.

Type 304 stainless steel is made susceptible to intergranular corrosion when heated at 1200 to 1400° F. That heat treatment imparts resistance to intergranular

corrosion for Type 430 steels.

Quenching from 1900 to 2000° F provides optimum resistance to Type 304 but makes Type 430 susceptible to intergranular corrosion. The major compositional difference in these steels is nickel (8 per cent in Type 304, none in Type 430).

Alloys containing intermediate nickel compositions were cast, rolled, heat treated, and tested to determine the influence of this element on corrosion behavior. It was found that the transition occurs at about 2.5 to 3 per cent nickel. Steels with higher nickel should be heat treated like the austenitic steels and those below like the ferritic steels.

An unexpected result was the good resistance to intergranular corrosion of all of these alloys when water quenched from 1400° F.—Lt. J. R. Upp, Wright-Patterson Air Force Base, Dayton, Ohio; F. H. Beck and M. G. Fontana, Ohio State University, Columbus, Ohio.

The Metal Selector

Did you get your copy? Published in the Metal Show issue (Oct. 28) of STEEL, it compiles data on types, uses, and availability of: 1. Wrought and casting copper alloys. 2. Wrought and casting aluminum alloys. 3. Ferrous castings. 4. Magnesium. 5. Titanium. 6. Zinc diecasting alloys. 7. Alloy and H-steels. 8. Stainless and heat resistant steels.

You can get a copy free by writing Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio. Request: "The Metal Selector." For quantities, the price is 10 cents a copy.

Carbide Precipitation and Brittleness in Austenitic Stainless Steel—Austenitic stainless steels lose ductility when deformed at high strain rates.

To determine whether carbide precipitation is responsible for

high speed embrittlement in stainless steels and to characterize the relationship of ductility with strain rate and temperature of deformation, tensile tests of annealed and sensitized austenitic stainless steels of varying carbon content—Types 304 ELC (0.024 C), 304 (0.060 C), 302 (0.09 C)—were conducted over a range of temperatures and strain rates. Conclusions:

1. At low strain rates, the steels exhibited a maximum in tensile ductility at room temperature as the test temperature was varied from -321 to 500° F.

2. At high strain rates, the steels gained steadily in ductility as the test temperature was increased.

3. At constant temperature, the steels lost ductility as the strain rate increased; the greatest loss occurred at room temperature.

4. The amount of martensite formed during deformation cannot be correlated with the ductility.

For the sensitized material:

5. The degree of sensitization was a function of the carbon level. Type 304 ELC was not embrittled, whereas Type 304 was embrittled but less than Type 302.

6. Carbide embrittlement manifested itself primarily in the range of low temperatures at low strain rates.

7. The carbide-embrittled specimens fractured intergranularly.

8. Carbide embrittlement cannot account for the high speed embrittlement which is characteristic of austenitic 18-8 stainless steel as a class.—A. Kramer and W. M. Baldwin Jr., Case Institute of Technology, Cleveland.

Chromium

Tensile and Stress-Rupture Properties of Chromium—Chromium-base alloys may become important high temperature materials. Chromium is abundant, has a moderately high melting point and excellent oxidation resistance.

Chromium is easily arc melted and fabricated by extrusion and swaging if the melting stock is first purified at 2900° F in pure, dry hydrogen. Processing raises the oxygen and nitrogen levels significantly above those obtainable after hydrogen purification.

These impurities probably do not

said the chip...

"I do a tale unfold"

This lathe chip, like many, many others, will go to the scrap pile. But there can be gold in the story that it tells.

Its color, size and shape pose questions like these: Is too much heat being generated by excessive speed, thereby causing short tool life and work distortion? Is speed too low, with resultant production loss? Is the rated horsepower of the machine too low or possibly too high for the expected metal removal? Is work finish unsatisfactory? Compressed into one overall question, is the inbuilt productiveness of the machine being realized on every cut of every part, day after day?

There's one certain, affirmative answer. Use Monarch's ultra-modern lathes—the Series 62 Pre-selector Dyna-Shift; the Series 80 and 90 Heavy Duty Dyna-Shift; the Series EE Model 1000. Chips from them are daily unfolding tales of increased output and lengthened tool life. It's quite possible the lathe chips in your plant would tell a story of real cost reduction, if "Made By Monarch". The Monarch Machine Tool Company, Sidney, Ohio.

You've never seen another machine like the Monarch Dyna-Shift Lathes with their "thinking headstocks." The Series 90 (above) is typical of a complete range of sizes featuring the Dyna-Shift way to reduced turning costs.

WHAT'S NEW IN METALS . . .

affect the properties at the higher temperatures. However, they may be important to strain-aging, and they certainly affect the ductile-brittle transition temperature, which is about 600° F.

Increased room temperature hardness results from treatments at 1600 to 2800° F. This may be caused by increased nitrogen in solution. It is not likely that this modifies the properties perceptibly, since the solution of nitrogen would only take place at test temperatures above the range where nitrogen is expected to be effective.

No yield points were observed in the tensile flow curves, but the characteristic temperature dependence of the tensile parameters suggests strain-aging. Yield points may be expected at temperatures lower than 600° F, and should be produced by chromium having a lower transition temperature.

A comparison of the tensile and rupture properties of chromium with those of molybdenum and tungsten is an impressive demonstration of the relationship between strength and melting point. More fundamental relationships, such as that of the heat content at the melting point, undoubtedly exist, as they do with hot hardness.

Chromium has a detriment or an advantage which is reflected by its melting point.

It is reasonable to expect chromium alloys to be most useful in a range below that of the higher melting refractory metals and above that of iron-nickel-cobalt base alloys.

It is estimated that chromium alloys, when they are developed, will be used mainly in the 1600 to 1800° F range for those applications which utilize the remarkable oxidation resistance of the metal.

—J. W. Pugh, General Electric Co., Cleveland.

WHAT'S NEW IN METALS . . .

effects of service temperature-time-stress histories to the mechanical properties of metals.

In this work, generalized expressions have been developed for the tensile properties of 7075-T6 and 2024-T3 clad sheet.

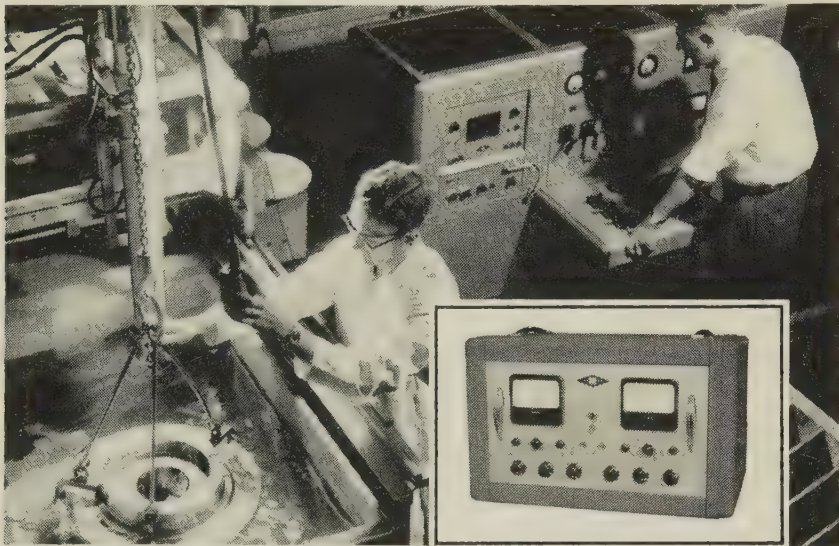

To obtain these, tensile tests were made at room temperature, 200, 300, and 400° F after single and sequential exposures sampling the temperature ranges of 300 to 600° F (2024-T3) and 250 to 500° F (7075-T6) and the time range of

0.1 to 1000 hours.

Normalization and generalization procedures were applied to the yield and ultimate tensile strength data, using semi-empirical parameters based on the rate-process theory. Statistical calculations were made to determine the degree of conformance of test data and generalized equations.

The conclusion was reached that the yield and ultimate strength generalized equations are adequate for analyzing the effects of those service time-temperature exposure

histories within the range of room temperature to 500° F and 1.0 to 1000 hours, and the room temperature to 400° F tensile strengths of subject airframe alloys. — R. E. Fortney and C. H. Avery, Northrup Aircraft Inc., Hawthorne, Calif.

Relation Between Constitution and Ultimate Grain Size in Aluminum — 1.25 Per Cent Manganese Alloy 3003—The grain size of annealed sheet of the aluminum alloy containing 1.25 per cent manganese (3003) is distinctly related to the thermal history of the material.

If ingot produced by the semi-continuous, direct chill method is given a high temperature homogenization heating, known as a "preheat," before hot rolling, it is not difficult to obtain a fine grain size with normal control.

Omission of the homogenization treatment leads to an undesirably coarse ultimate grain size. It was considered important to the fundamental understanding of grain size control to investigate the manner in which the constitution of the alloy was related to grain size.

The major microstructural difference between wrought products from 3003 aluminum alloy ingot which has or has not been given a high temperature homogenization heat treatment lies in the greater quantity of fine precipitate particles in the latter.

This high concentration of constituent particles leads to a modification of the normal recrystallization process in a manner which favors the formation of coarse recrystallized grains. The grain size in either case is a function of the recrystallization process only.

The highly concentrated precipitate imparts slightly higher strength, in addition to its effect on recrystallization behavior and grain size. — Philip R. Sperry, Kaiser Aluminum & Chemical Corp., Spokane, Wash.

Curtiss-Wright Ultrasonic Metal Testing Insures Quality Control

Nondestructive Test Equipment Inspects Critical Alloy Parts for Thompson Products

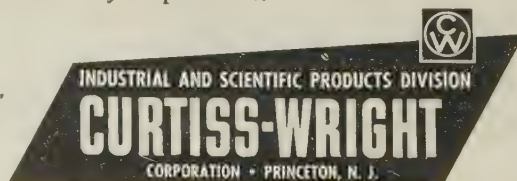

Under high stress conditions of jet aircraft and engine components, slight inclusions could become defects. To safeguard against flaws in high alloy turbine wheels, Thompson Products Company uses Curtiss-Wright Ultrasonic Test Equipment. High frequency sound waves become unerring flaw detectors.

The Immerscope, basic unit, detects internal flaws and presents them as visual pips on the cathode ray tube. The Dual Channel Flaw Calibrator (shown above) indicates the size of the flaw. It also provides two additional flaw alarm channels which allow a differentiation between size and type of flaw.

By console controlled manipulation, intricate shapes and surfaces may be inspected. Defects can also be recorded for immediate correction or reference.

Standard ultrasonic testing and immersion units and automatic inspection installations tailored to your applications insure great savings in machining time and quality control. Curtiss-Wright engineers are available to give prompt consideration to your problems.

Titanium

Evaluation of New Titanium-Base Sheet Alloy, Ti-4Al-3Mo-1V—With increasing uses for titanium and its alloys in high-speed aircraft, a higher strength titanium sheet al-

WHAT'S NEW IN METALS . . .

alloy was needed which could be heat treated to a room temperature, ultimate strength of 170,000 to 180,000 psi. It had to possess good strength and stability under stress in the heat treated condition to temperatures of 800° F.

In an effort to satisfy this requirement, the Ti-4Al-3Mo-1V composition was developed as a moderate strength, heat treatable alloy for sheet applications. It is now in semicommercial production.

Because Ti-4Al-3Mo-1V is a heat treatable alloy, most of the evaluation was performed on the basis of a study of its solution treating and aging characteristics.

Particular emphasis was placed on solution treating to achieve a minimum yield-to-tensile strength ratio which occurred at a solution temperature near 1550° F.

Solution temperatures of 1600 to 1700° F resulted in bendability that was comparable with that obtained at 1550° F, although the solution treated, tensile ductility decreased above 1600 to 1650° F. Temperatures higher than 1550° F were required to obtain aged, ultimate tensile strengths in excess of 170,000 psi.

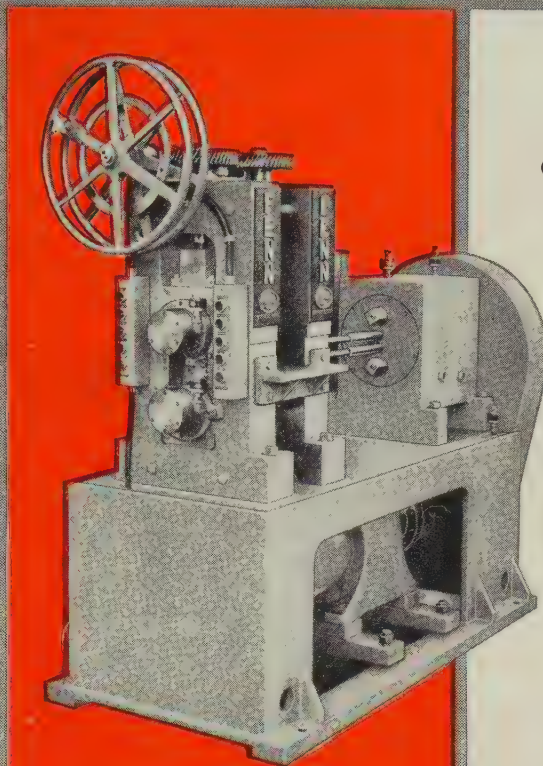

Little sacrifice in solution treated tensile strength and bend ductility was observed at a solution temperature as high as 1650° F which resulted in ultimate tensile strengths of 190,000 to 195,000 psi after aging at 900° F for 24 hours. This strength advantage at room temperature (obtained by using a higher solution temperature) also persisted to 1000° F.

Heat treated sheet was stable under stress of 50,000 psi at 800° F for periods to 1000 hours, although the loss in ductility after elevated temperature exposure under stress was somewhat greater in the higher strength condition obtained by solution treating at 1650° F.

No embrittlement was detected. Total creep deformation of material solution treated from 1550° F and aged at 850 to 1000° F was in the range of 1.1 to 1.4 per cent at 800° F after 1000 hours at 50,000 psi.

Material solution treated from 1650° F and aged at 900 to 1000° F showed deformation from about 0.1 to 0.5 per cent; the exposure

WHAT'S NEW IN METALS . . .

time was only 300 hours at 800° F and 50,000 psi, so no direct comparison with the 1550° F solution treated material can be made.

Limited formability tests on larger resistance, solution treated pieces of sheet showed that the material bent satisfactorily at room temperature around a radius of 4.0 T and that subsequently it could be stretch wrapped and joggled at room temperature.

A preliminary welding study

showed that weld strengths were comparable with those of the base metal, although the as-welded ductility was at a low level. Post-welding annealing appears to offer some promise in improving weld ductility, and good bendability (3.3T) can be obtained in the weld following a solution treatment of 1550° F (½ hour) WQ.

Porosity in the weldment somewhat limits the reliability of test results which, if anything, would indicate that Ti-4Al-3Mo-1V sheet is not readily weldable using pres-

ent fusion welding techniques.—R. S. Richards, D. L. Day, and H. D. Kessler, Titanium Metals Corp. of America, Henderson, Nev.

Carburizing Stresses

Distribution of Residual Stresses in Carburized Cases and Their Origin—Carburizing gives an extremely hard, long wearing surface on easily fabricated low carbon and low alloy steels. The combination of surface hardness and high strength and toughness in the core is valuable under certain types of applied stresses.

A valuable byproduct of these case-hardening treatments is the residual compressive stresses in the hardened surface layers. The benefit from these residual compressive stresses in fatigue applications depends on their exact magnitude and depth distribution.

In this work, the residual stress distributions in carburized cases on SAE 8620, 1118, 1018, and 5140 steels were studied using a precision x-ray diffraction technique.

The stress distribution throughout the case was correlated with the carbon distribution as determined chemically and with the crystalline phase composition.

Some general conclusions may be drawn:

1. The magnitude and distribution of the compressive stress at every depth in a carburized case is determined by the extent of the transformation to martensite and the sequence in which these transformations occur.

2. Maximum compression occurs at 50 to 60 per cent of the total case depth. In low-carbon core samples studied, this corresponds closely to the point at which the carbon content drops below 0.5 per cent.

3. The reversal in the sign of the residual stress from compression in the case to tension in the core occurs at or near the case-core boundary.

4. Proceeding outward through the case from the case-core boundary to the point of maximum compression, the stress becomes more compressive due to sequence of the transformations to isothermal transformation products or to martensite.

5. Proceeding outward through

Now! Ajax SALT BATH FURNACES with REMOVABLE SUBMERGED ELECTRODES

What used to be a costly, time-consuming job now takes only an hour or two at the most. Labor cost is next to nothing . . . and there is little or no "down time" for the heat treating equipment because Ajax Removable Submerged Electrodes can now be changed without tearing down either the furnace wall or the pot.

Electrodes enter from over the top and slant into the salt bath. *There are no openings below the salt line.* A ceramic tile over each pair of electrodes

seals off all air and eliminates corrosion at the salt line. *Thus, all the inherent advantages of submerged design are assured.*

To expose the electrodes for rapid removal, it is only necessary to lift the tile. The entire job can be handled by unskilled labor. Actual electrode changing time is less than an hour per pair.

VERIFICATION: Measurements of Hydraluster and Tube X were made on The Proficorder—an instrument of our manufacture for accurately showing the true profile of practically any machined or finished surface. The tests were conducted in our laboratories under my personal supervision. And I verify that both tubes were measured under identical conditions. The resulting graphs show the exact differences in the samples furnished. **Douglas Palmer** — Chief Inspector, Micrometrical Mfg. Co., Ann Arbor, Mich.

In micro-inch comparison of hydraulic tubing ...

HYDRALUSTER shows smoothest, most friction-free I.D.

These graphic red lines are recorded measurements showing a surface profile *inside* both HYDRALUSTER and a length of standard hydraulic tubing. *Both tubes were selected at random from warehouse stocks, then accurately measured in microinches by the sensitive stylus of the famous PROFICORDER.*

Hydraulic system efficiency and dependability, in a large degree, depend on factors illustrated by the red lines. Tube X is not a scrap piece of tubing. In fact, it represents a quality grade purchased and used every day. Which tube would you select to offer the least resistance to hydraulic flow . . . to transmit fluid with the least amount of pressure drop . . . and to create the least fluid turbulence?

Hydraluster is the answer, of course. And Hydraluster is the right tube to specify when you want to insure these same performance characteristics in your hydraulic systems.

SAMPLES AND SPECIFICATIONS: Examine Hydraluster finish yourself. Your name on company letterhead will bring specifications and a sample by return mail. *Hydraluster is sold at standard carbon hydraulic tubing prices.*

WHAT'S NEW IN METALS . . .

the case from the point of maximum compression to the surface, the magnitude of the compressive stress decreases as the amount of martensite is restricted by incomplete transformation of the austenite.

6. On some carburized specimens, thin surface films may occur in which there are wide variations in phase compositions and correspondingly wide variations in residual stress.—D. P. Koistinen, General Motors Corp., Detroit.

Endurance Limit

Effect of Per Cent Tempered Martensite on Endurance Limit—The effect of microstructure on the endurance limit of the following steels was investigated: SAE 1340, 4042, 4340, 5140, and 80B40. By using different quenching media and by changing the cross section of the quenched bars, various amounts of martensite were produced by continuous cooling.

A relationship exists between the percentage of martensite formed on quenching and tempering to 36 Rockwell C and the endurance limit. A small percentage of nonmartensitic structure has an adverse effect on the fatigue strength of the steels tested. Below 85 per cent martensite, the endurance limit is affected little by microstructure.

In the application of hardenability to design, some specifications require 90 per cent martensite at the $\frac{3}{4}$ radius. In less stringent specifications, 80 per cent martensite is required and in still less, 50 per cent martensite is required.

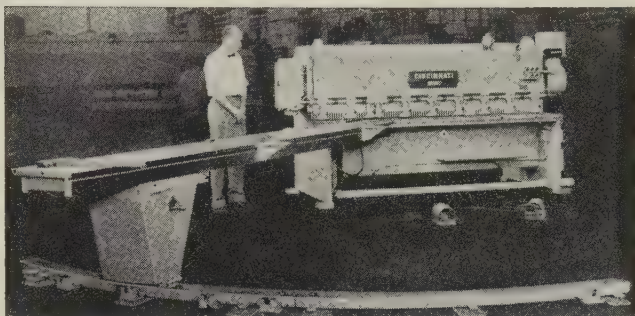

Provided that 100 per cent martensite is obtained at and just below the surface, there appears to be little difference between the 50 per cent and 80 per cent martensite requirement at the $\frac{3}{4}$ radius. The 90 per cent martensite would give a higher endurance value at this point.

If the surface is less than 100 per cent martensite, the endurance limit drops off rather sharply to the 90 per cent value and less sharply to the 85 per cent value.—F. Borik, R. D. Chapman, and W. E. Jominy, Chrysler Corp., Detroit.

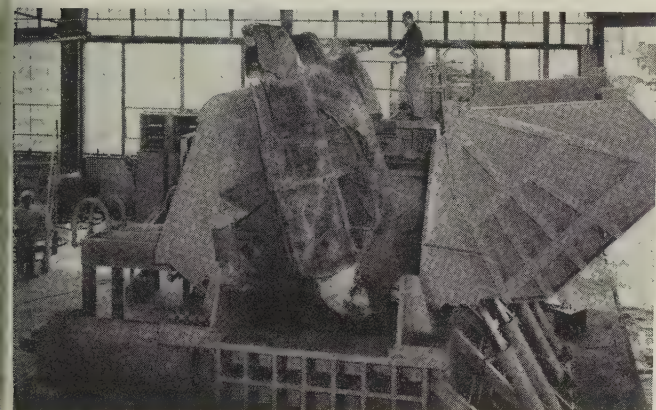

Shear Cuts Angles Within a Tolerance of 2 Minutes

The angular shearing gage with this 10 Series by 3 ft shear accurately gages the length of the sheared pieces. All gage stops are equipped with micrometer adjustments. Accuracy is insured by hydraulic hold-downs which clamp with 5 tons of pressure.

The shear operates at 65 strokes a minute. The carriage moves easily between angular gaging positions. Pivot point for the shearing gage is in the shear table. *Write:* Cincinnati Shaper Co., Hopple, Garrard, and Elam Streets, Cincinnati 25, Ohio. *Phone:* Kirby 1-5010

Baling Press Handles Car Bodies in 2½ Minutes

The Dempster-Balester 2000 does a prebaling operation between its auxiliary compression door and a skip pan loader. This reduces the dimensions of a car body so that it can be placed easily into the medium-size charging box (48 in. deep, 72 in. wide, and 144 in. long).

Prebaling takes less than 1 minute; the automatic baling cycle is completed in 90 seconds.

Bales are about 24 x 24 x 48 in. They weigh from 1500 to 2000 lb.

Press features: Pushbutton controls, automatic compression, and return of main rams. *Write:* Dept. S-B, Dempster Bros. Inc., Knoxville 17, Tenn. *Phone:* 4-1671

Gear Checker Inspects Spur or Helical Gears for Concentricity

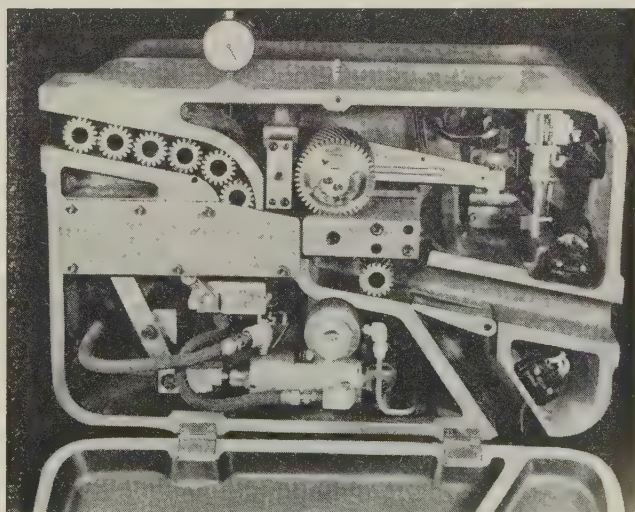

This automatic gear monitoring unit can inspect a gear every 6 seconds.

The amount of eccentricity in the gear is determined by using conjugate rolling action in two directions of rotation with a master gear in mesh with the part.

After checking, parts within predetermined tolerances are passed automatically to the next operation; parts that are eccentric are shunted from the system.

The accuracy adjustment is infinitely sensitive to eccentricity errors.

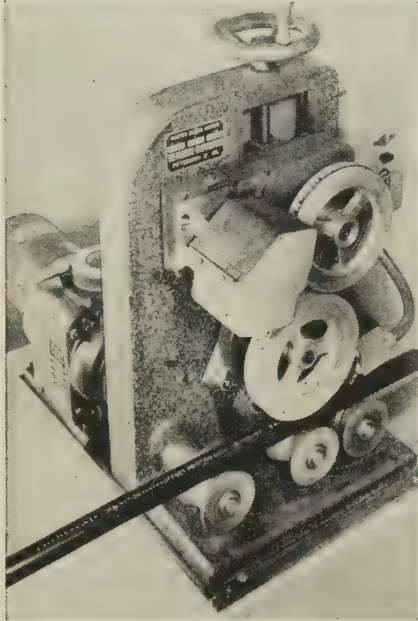

The unit is designed for use in automated production lines. One central panel can electrically operate allied automation units. The gear checker comes in a range of sizes. *Write:* Michigan Tool Co., 7171 E. McNichols Rd., Detroit 12, Mich. *Phone:* Twinbrook 1-3111

Offset Tube Printer

Material from $\frac{1}{8}$ to 4 in. OD can be handled by this wire, bar, and tube printer without changing guide wheels.

The unit will print a continuous message, set on a 24-in. offset printing wheel, in type sizes from $\frac{1}{16}$ to 1 in.

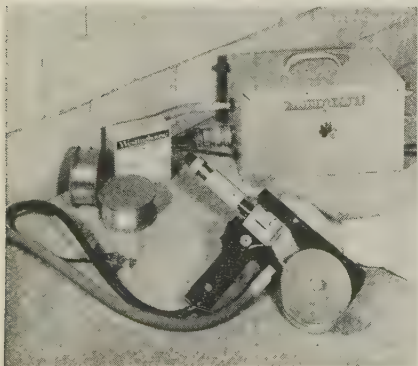

A $\frac{1}{2}$ -hp motor drives the material through the marking head at speeds of 45 to 450 lineal feet a minute. *Write:* Pannier Corp., 220 Sandusky St., Pittsburgh 12, Pa. *Phone:* Fairfax 1-5185

Aluminum Welder

This portable inert gas welder has an integrally mounted wire drive (motor driven) and a wire supply.

There are two models. One handles filler wire $\frac{1}{50}$ to $\frac{3}{64}$ in. in diameter; the other is for wire from $\frac{3}{64}$ to $\frac{1}{16}$ in. in diameter.

Travel speeds for horizontal fillets average 22 ipm with $\frac{1}{16}$ in. filler wire.

Gas and welding current are delivered to the gun by a hose assembly in which argon flows around the central conductor.

The gun weighs less than 4 lb when loaded with 1 lb of filler wire. *Write:* Westinghouse Electric Corp., Box 2278, Pittsburgh, Pa. *Phone:* Express 1-2800

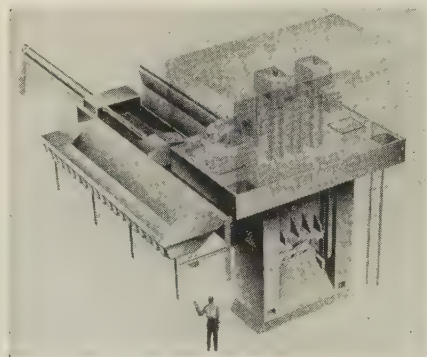

Shell Parting

LF-460 is a silicone parting emulsion used with the shell molding process. The emulsion, dimethyl silicone oil, is shipped in a concentration of 35 per cent. Diluting it with tap water and stirring ready it for use.

The parting has low film buildup. This practically eliminates sludge formation on the pattern. *Write:* Silicones Div., Union Carbide Corp., 30 E. 42nd St., New York 17, N. Y. *Phone:* Murray Hill 7-8000

Scrap Shear

The Hydra-Shear develops 600 tons of pressure and can cut up to 30 tons of scrap an hour. Its shear blades are easily adjusted to compensate for wear and will cut all types of scrap steel to meet specifications of mills and foundries.

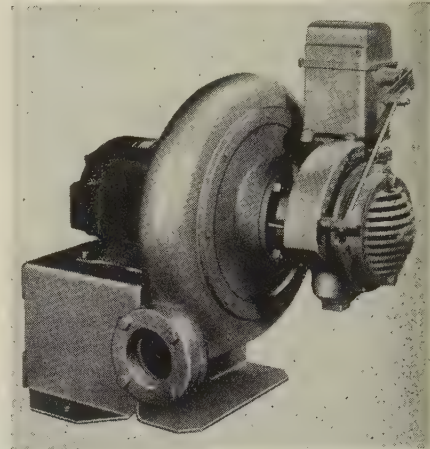

The feed hopper (22 ft x 6 ft x 1 ft 10 in.) is loaded with scrap and tilted by hydraulic cylinders to dump the scrap into a charging box.

A hydraulic ram operating through the charging box pushes the scrap into the shear position. The stroke of the charging ram is adjustable in 6-in. increments from 6 to 48 in. Scrap can be cut into desired uniform lengths.

While scrap is being fed into the shear, the hopper is reloaded. *Write:* Consolidated Mill Supply Co., 5843 S. Loomis Blvd., Chicago 36, Ill. *Phone:* Walbrook 5-5000

Combustion Control

Series 20 Unimix machines (manual or automatic) deliver air-gas mixtures for 800,000 to 2,350,000 Btu maximum burner input and 215,000 to 500,000 Btu minimum burner input.

Up to nine gas orifices in the manifold are uncovered, one at a time, as the air valve moves from closed to open position. Individual openings are adjusted manually and are predetermined according to the type mixture desired.

Air and gas are drawn in by the blower. *Write:* Industrial Combustion Div., Eclipse Fuel Engineering Co., Rockford, Ill. *Phone:* 8-3751

Hot Sinter Screen

This screen can handle 132 tons an hour of hot sinter at about 1400° F with hot spots up to 2400° F. It operates at 800 rpm with a $\frac{3}{8}$ -in. amplitude.

The screen is used in a sintering operation which agglomerates fine ore into the larger size particles needed for blast furnaces.

Heat and wear resistant grate sections of the screen are made of high chrome iron. These sections are bolted to seven pallet assemblies with stainless steel bolts. The self-supporting pallet assemblies are made of tubular cross members (316 stainless) welded to stainless steel angles for bolting to the screen body.

Side plates and the back plate of the screen body are made of

High Lifts

The Triplex Mast provides maximum fork heights of 108, 144, 180, 198, and 210 in. Three nested, I-beam lifting members are raised hydraulically by a multistage cylinder.

Only two single lift chains are needed to operate the cylinder. The rest of the space between the cylinder and uprights is left open to give the operator a view of the load being handled. The chains work on a single pair of sheaves to transmit lifting power to the mast. *Write:* Materials Handling Div., Yale & Towne Mfg. Co., 11000 Roosevelt Blvd., Philadelphia 15, Pa. *Phone:* Orchard 3-1200

Power Groover

Single and Pittsburgh lock seams are made by eight models of the Giant Power Groover. Mild steel up to 16 gage can be handled. Working lengths range from 4 to 10 ft.

Power is supplied by a reversible gearhead motor with a built-in

brake to stop the carriage quickly for a rapid return stroke. The carriage is returned to the starting position automatically. *Write:* Niagara Machine & Tool Works, 683 Northland Ave., Buffalo 11, N. Y. *Phone:* Taylor 4070

Furniture Tube

The No-Buff aluminum tube is made in rectangular, oval, and square forms. There are two grades: High strength, which can be easily punched, drilled, dimpled, or formed; and all-purpose, which is readily flattened and formed and is hard enough to be used with riveting and other fastening methods.

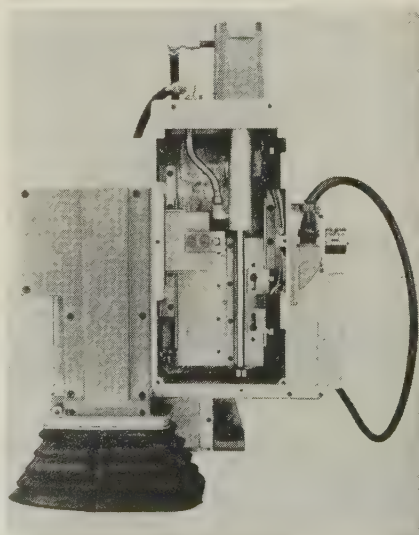

Both types are individually wrapped in protective paper. A wide range of wall thicknesses and diameters is available. *Write:* Harvey Aluminum Sales Inc., 19200 S. Western Ave., Torrance, Calif. *Phone:* Nevada 6-2111

Wheel Dresser

Model 89 is a contour wheel dresser used with cylindrical grinders. It will dress any angle on the wheel, perpendicular or horizontal.

The dresser can undercut grinding wheels and dress at uniform peripheral speed.

Computed templates for profile

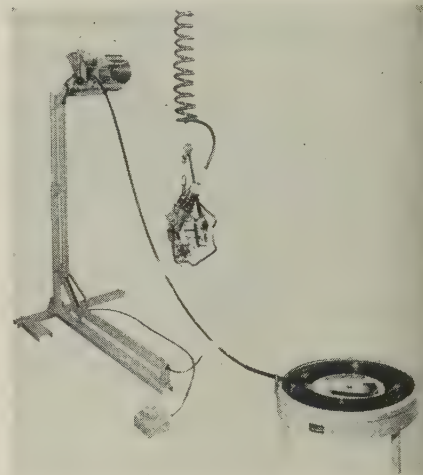

widths up to 6 in. and depths to 3½ in. are available with the unit. It uses an inclined plane cam reduction mechanism. *Write:* Hoglund Engineering & Mfg. Co. Inc., 343 Snyder Ave., Berkeley Heights, N. J. *Phone:* Crestview 3-7183

Power Strapper

Model PSF-1 feeds steel strapping vertically around packages, skids, crates, or bundles. Strapping can be fed at a rate up to 240 ft a minute.

When used with power operated strapping tools, it applies up to 200 straps an hour.

The feeder can be mounted on a conveyor or set up as a separate strapping station. It handles strapping from 5/16 in. wide by 0.012 in. thick to ¾ in. wide by 0.035 in. thick.

Excess strapping is fed back to the coil to prevent waste. *Write:* Signode Steel Strapping Co., 2600 N. Western Ave., Chicago 47, Ill. *Phone:* Armitage 6-8500

Boring Machine

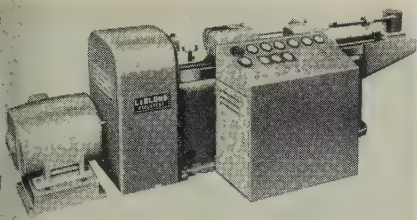

The LeBlond-Carlstedt Rapid Borer does solid boring, trepanning, and counterboring of long holes. The borer has capacity for holes 5/16 to 4¼ in. in diameter.

The machine is suited to work that is symmetrical—round, square, octagonal, tapered, or stepped. It uses a tool which cuts at high speed with excellent accuracy and finish.

Cutting oil is forced between the boring bar and the hole wall, forming a continuous bearing. It flushes back through a hole in the boring head and bar, carrying away the chips.

The chip form is controlled by

JONES & LAMSON MACHINE COMPANY

the man who needs
a new machine tool is
already paying for it

Still useful, yes . . . but is it still Profitable?

When the purchase of new machine tools comes up for discussion, it's not at all unusual for someone to comment — "but our present machines still seem to be doing a good job".

On the surface, this objection seems to make good sense. It doesn't stand up, however, because it isn't good economics.

While surveying a number of metalworking plants recently, a prominent industrial publisher discovered this startling fact: — *In every plant with machinery more than ten years*

old, profit margins were steadily falling!

Why should this be the case, especially when sales were at an all-time high?

The answer, of course, is that older, still "useful" machines cannot produce enough goods at a low enough cost to compete favorably with new machines on a profit basis.

Write for J & L's Replacement Information Kit, which contains much valuable information. Jones & Lamson Machine Company, 517 Clinton St., Springfield, Vermont.

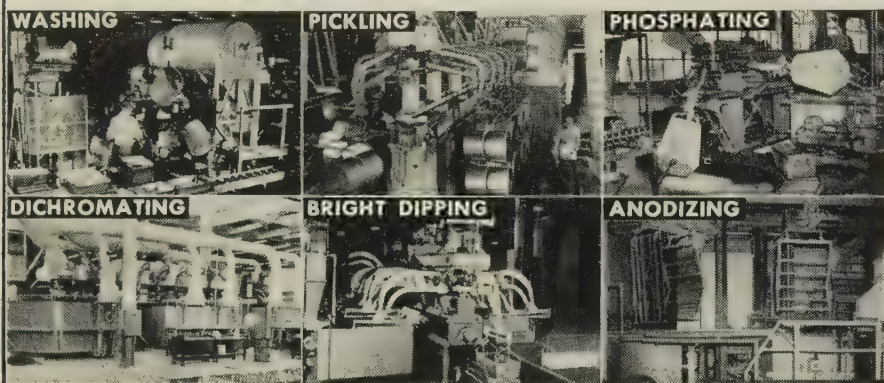

THE FINISHING TOUCH

A. B. HOEFER, Vice-President, FREDERIC B. STEVENS, INC.

AUTOMATIC IMMERSION PROCESSING RESULTS IN REAL SAVINGS!

MORE AND MORE, PROCESS ENGINEERS are recognizing the money savings to be realized from automatic processing installations, i.e. *Anodizing and other aluminum immersion treatments; Blackening; Bright Dipping; Dichromating; Cleaning; Pickling; Washing; Phosphating* for rust prevention; wear resistance, and prior to cold drawing; *Stripping* as well as *Electroplating*.

These Stevens Automatic Processing Machines are cutting costs.

"PROFIT-MAKING MACHINES" was one term recently used by a Stevens Automatic Machine user. Money saved in labor, floor space, production control and similar costs, if tacked on the other end, could very easily be termed "profit."

IN ANALYZING AUTOMATIC MACHINE USERS at Stevens for the past three years we were interested in the increased number of processing applications which manufacturers are adapting to this versatile equipment.

AUTOMATION HAS INFLUENCED THESE INCREASES, for our automatic machines fit ideally into "straight line" production layouts and eliminate handling and human error so costly in today's modern manufacturing techniques. All of our machines can be equipped with automatic load and unload features and have flexibility which enables them to be used for a variety of metal treatments.

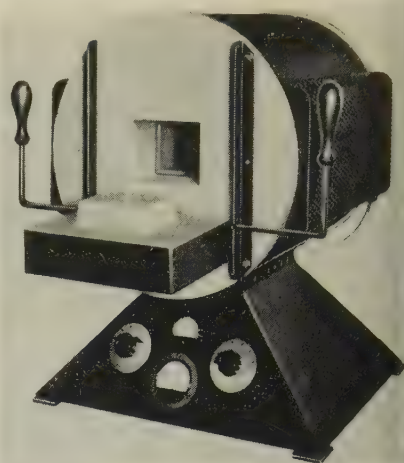

IF YOU ARE A PROCESS ENGINEER, or occupy a similar post of responsibility in your plant, contact your Stevens sales engineer or write for more information on automatic immersion processing as well as electroplating. Let us show you how you can recommend methods to save your company money. Write: Frederic B. Stevens, Inc., 1800 Eighteenth Street, Detroit 16, Michigan.

Box for Hot Materials

This steel box is made of a low alloy, high tensile steel to provide the strength needed in handling hot work such as castings, forgings, and special parts after annealing.

The box is 38 x 53 x 26 in. and made of 7 gage steel. One box can be stacked on top of another.

The box stands 16 in. from the ground to provide clearance for handling by fork lift trucks. Write: Pressed Steel Div., Republic Steel Corp., 6100 Truscon Ave., Cleveland 27, Ohio. Phone: Michigan 1-0810

Slot Deburrer

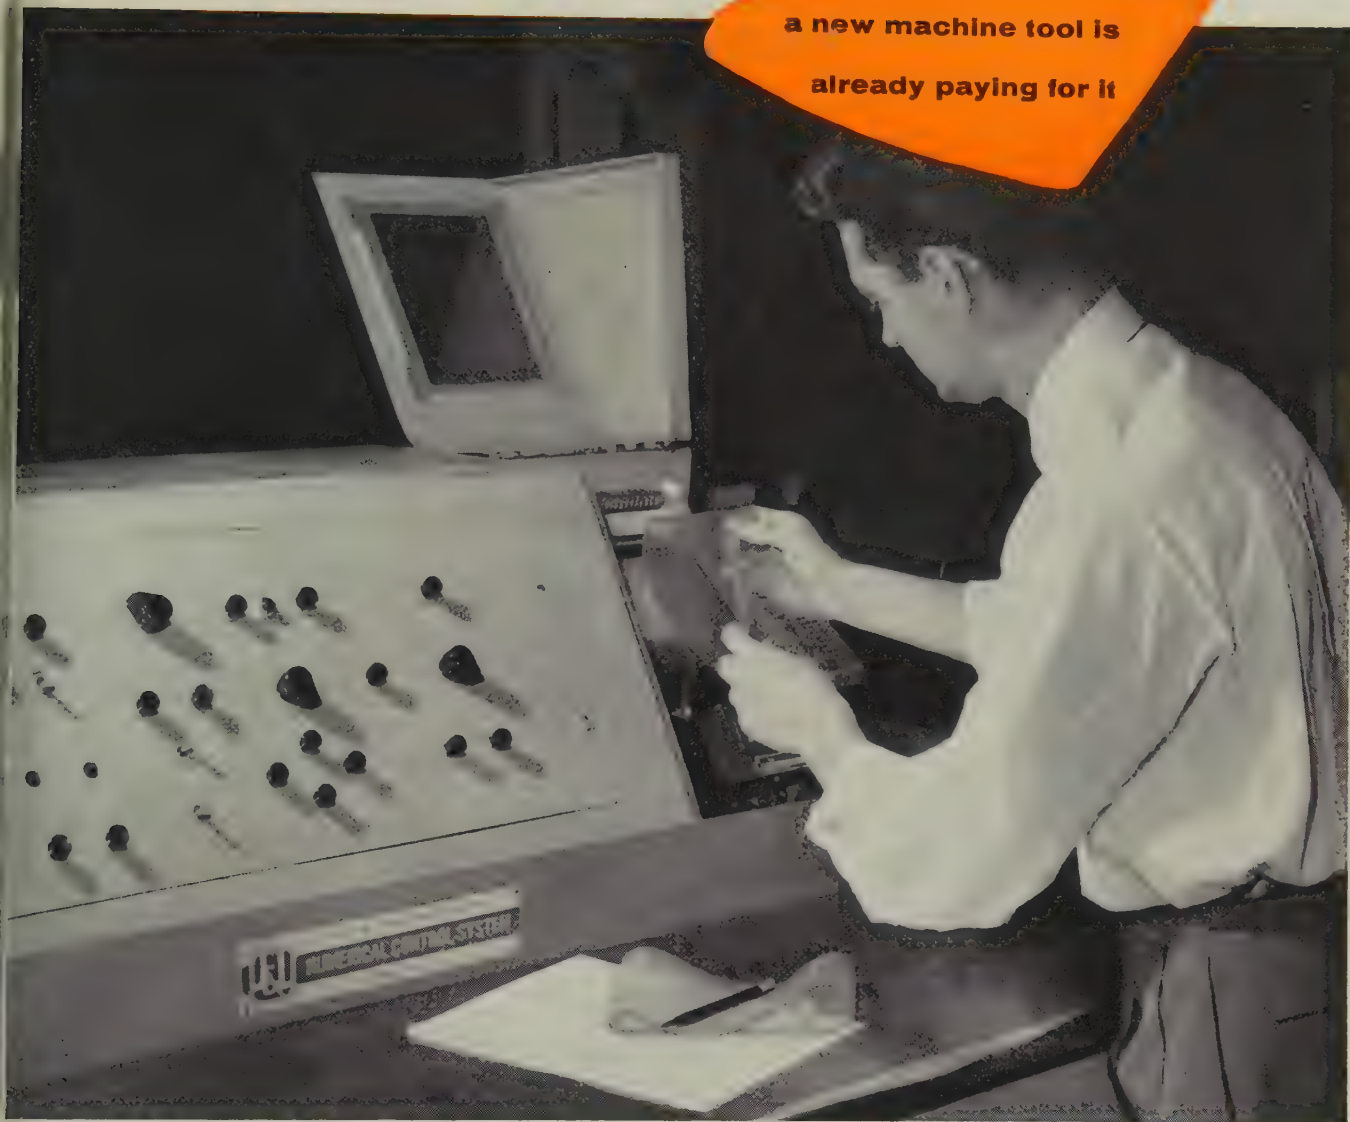

Model BMI-15M will deburr and chamfer slots around the periphery of a part. The machining cycle is automatic.

Form tools, reciprocating at 2 1/2 strokes a second, straddle cut each slot. Each tool chamfers (and deburrs) one side and half of the bottom of each slot.

Cutting cycle per slot is 3 seconds. Sharp edges on the outer

JONES & LAMSON "AUTOMATION"

the man who needs
a new machine tool is
already paying for it

J&L's Unique Approach to "Automation"

"Automation" is a tricky word — one that has many definitions. However, at Jones & Lamson its basic meaning is always the same ... "the solution to a cost reduction problem".

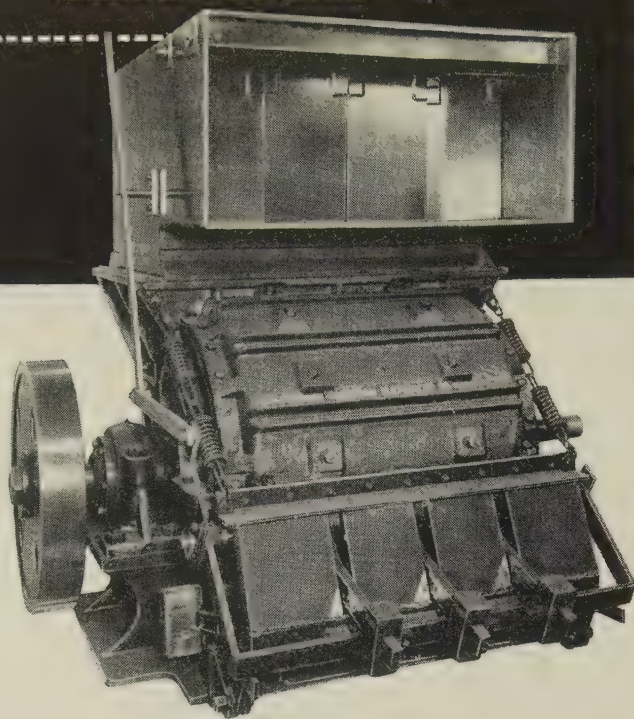

In some cases, this could involve automatic in-process gaging, size adjustment feed back, self-resetting of tools, and automatic handling for long runs on single machines. Other problems might call for an articulated, sequential line of machines, complete with automatic handling, inter-machine transfer and auto-

matic control of speeds, feeds, etc.

Through numerical control, using punched tapes, J&L "automation" *also greatly increases small-lot flexibility*. In this case, machine set-up and change-over become primarily an office procedure.

We would be pleased to show you how J&L's approach to "Automation" can be put to good use in *your* operations. Write for literature — Jones & Lamson Machine Company, 517 Clinton St., Springfield, Vermont.

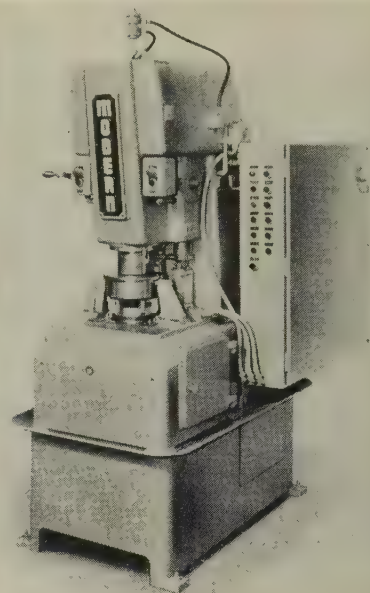

convert metal turnings into cash

Long, curly, troublesome metal turnings, reduced in an American Metal Turnings Crusher, can produce additional profits for your plant.

Reduced to chip form, metal turnings bring \$2 to \$5 more per ton. Handling metal chips by shovel or pneumatic systems is easier, too, and chips require 75% less storage space than bulky machine turnings. You'll recover more cutting oil from chips . . . up to 50 gallons per ton! More important, American Metal Turnings Crushers pay for themselves and produce substantial profits for years to come. Models available with capacities ranging from 1 to 50 tons per hour. To get all the details, write American today.

JONES & LAMSON OPTICAL COMPARATORS

the man who needs
a new machine tool is
already paying for it

Simulated machining operations give production control as well as absolute inspection

At J&L we answer an inspection problem by asking, "How was the piece made?"

Take, for instance, this inspection of broached slots in turbine discs. Holding fixtures are similar to those used in the actual broaching operation. Measurements are taken, right and left, as on the broaching machine. During inspection, the part moves in the same planes as it does while it is being machined. And the combination of light, optics and chart act as the cutting tool.

Through this visualization of the machining operation, it is a simple matter for the operator to take measurements on the comparator and then go back to the broaching machine to make any necessary adjustments.

Thus, with J&L, you not only inspect end products but, more importantly, you find out *where* and *when* to adjust the manufacturing process. Write to Jones & Lamson Machine Company, 517 Clinton Street, Springfield, Vermont, for literature.

HOW *Cambridge* Woven Wire Belts help Heat Treaters

increase uniformity,
speed production

By providing continuous movement through heat treating cycles, woven wire conveyor belts eliminate batch handling, increase product uniformity and production capacity in annealing, brazing, quenching, tempering, sintering, etc. **EXAMPLE:**

Continuous Annealing

MOVING BELT carries a stream of brass light bulb ferrules through furnace for continuous uniform annealing at 1400° F.

OPEN MESH of Cambridge belt allows free circulation of heat around load so that hot spots are eliminated. Open mesh construction also permits rapid drainage in wet processes such as quenching and washing.

ALL-METAL BELT withstands heat up to 2100°F. (as in copper brazing) without damage, provides lasting strength because there are no seams, lacers or fasteners to break or wear.

SPECIAL RAISED EDGES hold parts on belt, are typical of a variety of side and surface attachments available to hold the product during flat or inclined movement.

Cambridge Woven Wire Conveyor Belts are made in any size, mesh or weave, from any metal or alloy, and can be used under a wide range of conditions . . . hot or cold, wet or dry. Call your Cambridge Field Engineer to discuss how you can cut costs with continuous processing on woven wire conveyor belts. Look for his phone number under "Belting, Mechanical" in the Yellow Pages or write for **FREE 130-PAGE REFERENCE MANUAL.**

Wholesale Hollow Milling with J&L Die Heads

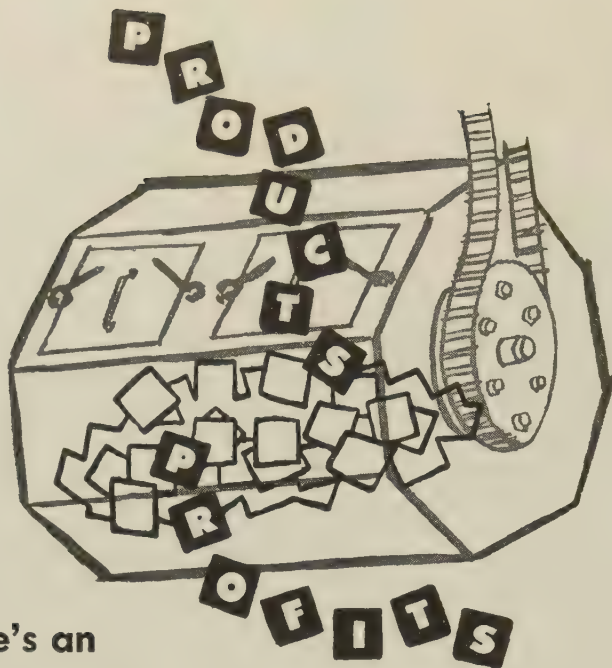

This is part of a transfer machine set-up that uses 48 J&L Die Heads on hollow milling operations. Rough and finish turning is performed on both ends of automotive suspension shafts, as 1440 finished parts come off the line every hour.

Even in single spindle set-ups, hollow milling chasers in J&L Die Heads remove metal *four times faster* than single point tooling. And in many cases, J&L threading Die Heads can

be adapted to hollow milling, by merely using the required turning chasers.

Chasers for multiple turning and contour forming, as well as straight or taper turning, can be used in J&L Die Heads for hollow milling on most types of turning equipment.

Write for booklets — "Hollow Milling with Die Heads", and "Let's Talk about Thread Tools". Jones & Lamson Machine Company, 517 Clinton Street, Springfield, Vermont.

Here's an
exciting new game:

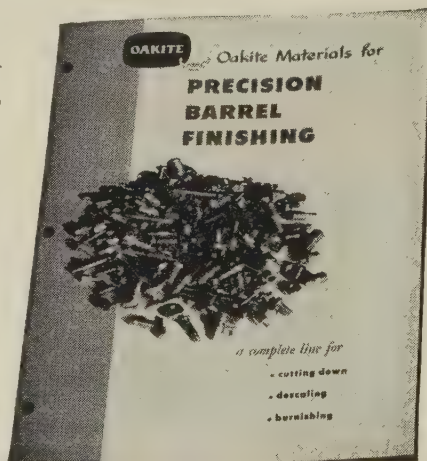

PUT your products in the barrel TAKE your profits out

One of the greatest money-saving opportunities in metalworking lies in the use of barrels to finish parts by the hundreds in place of conventional methods that finish one part at a time.

Barrel finishing makes easy work of many tough jobs of grinding, deburring and buffing by wheel.

One Oakite customer changed to barrel methods to deburr curved stainless steel strips that are 14 inches long. The cost for deburring 20,000 strips was reduced from \$3,000 to \$125.00.

FREE For a copy of "Precision Barrel Finishing"—containing valuable information on cutting down, deburring, descaling, and burnishing—write to Oakite Products, Inc., 34E Rector Street, New York 6, N. Y.

Welding Positioners

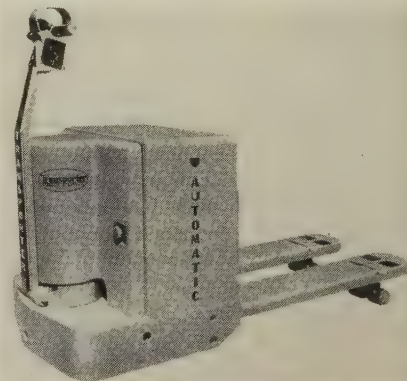

This small positioner comes in capacities of 100 and 250 lb. Both have 165 degrees of manual table tilt (30 degrees back tilt).

A 1/4-hp variable speed transmission powers the table. The 100-lb model has speeds of 1 to 10 rpm. Speeds from 0.52 to 5.2 rpm are obtained on the 250-lb unit. Write: Pandjiris Weldment Co., 5151 Northrup Ave., St. Louis 10, Mo. Phone: Prospect 6-6893

Trucks Have Extra Power

Transporter models WPY-4 and WPY-6 are low lift pallet trucks with 4000 and 6000 lb capacities. A 15 1/2-in. battery compartment can hold a six-cell lead acid battery with 23 plates, or the equivalent.

The truck is only 29 in. long (plus the length of the load). Maximum steering angle is 200 degrees. Write: Automatic Transportation Co., division of Yale & Towne Mfg. Co., 149 W. 87th St., Chicago 20, Ill. Phone: Radcliffe 3-7000

OUTLOOK for steel demand the rest of the year is mixed. Some steel producers are noting a decline in their incoming orders, and even a few cancellations of orders on the books; other mills are reporting a slight improvement in new business.

With few exceptions, mills are current on deliveries. The exceptions are principally where wide flange beams and heavy plates are involved, but even here, producers are gaining on their commitments.

INCENTIVE—Idleness of a little more than 20 per cent of the nation's steel ingot capacity spurs steel producers to give the quickest possible delivery, lest orders be lost to competitors.

Consumers know they can get early delivery, and they see no reason to have money tied up in large stocks of raw material. In states where users are subject to yearend inventory taxes there is an additional incentive to reduce the amount of material on hand. As a result, buying is principally for immediate consumption.

PREPARED—To get into position to provide quick delivery, mills built up their stocks of semifinished steel in the last four to six weeks. With that activity finished, the ingot rate will more nearly reflect receipts of new orders. The rate will be a trifle lower than it was even though the flow of new orders holds steady.

OUTPUT EBBS—Such a decline in the ingot rate has been apparent in the last two weeks. In that period, the rate has slipped off 2 points. In the first week, it declined from 81 to 79.5 per cent of capacity. In the week ended Nov. 3, operations edged down to 79 per cent.

The month just ended—October—yielded around 9.2 million net tons of steel for ingots and castings, compared with 8,995,000 tons in September. The increase in tonnage is due solely to the fact October is a 31-day month. September, with one less day, had a larger daily average production.

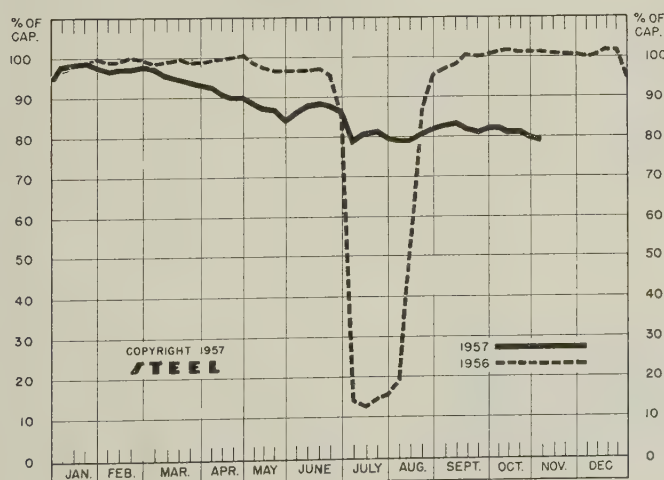

TEN-MONTH TOTAL—October production raised the total for the first ten months to around 96.9 million net tons. Continuation of the current rate of output would make the year's total between 114.5 million and 115 million net tons. The record is 117 million tons (1955). Last year, output was 115 million tons, the second highest in history.

Many observers think steel demand will hold at its present rate the rest of this year, and perhaps well into the first quarter of 1958.

SCRAP FALLS AGAIN—The scrap market reflects such thinking. Prices of steelmaking scrap are dropping at a time when it would be normal for them to rise. The eleventh consecutive week of decline knocked \$1.50 from STEEL's scrap price composite. It lowered the composite to \$35.33 a gross ton, almost \$30 below what it was at the start of this year. Steel-making scrap is lower now than it was at any time last year.

PREMIUM PRICE FADES—Another premium price on plate mill plates vanished when the Claymont, Del., plant of the Wickwire-Spencer Steel Div., Colorado Fuel & Iron Corp., cut \$12 a ton off its quotations on the plain carbon and the carbon abrasive products. The mill's prices are now the same as those of its competitors.

A welder caused us to caucus

The note from an employee suggestion box read "How come a company like this hasn't got the U. S. Savings Bond Payroll Savings Plan". It was signed by a welder in the fabricating department.

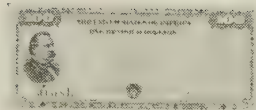

Since we actually *do* have Payroll Savings this told us two things: (1) Probably more employees than we imagined wanted the advantage of buying U. S. Bonds automatically through Payroll Savings. (2) We had grown lax in bringing our Plan to their attention.

But what to do? The solution was simplicity itself.

We called in our State Savings Bonds Director. He provided all the promotional materials needed to arouse interest in U. S. Savings Bonds. Then he helped to conduct a personal canvass and place an application blank in everyone's hands.

The results were amazing. Employee participation shot up to a percentage that we could take pride in. There was no "hard selling", nor was work interrupted. Our people wanted the security U. S. Savings Bonds offer them.

Today there are more Payroll savers than ever before in peacetime. Your State Director will be happy to help you install a Payroll Savings Plan or build enrollment in one already existing. Look him up in the phone book or write: Savings Bonds Division, U. S. Treasury Dept., Washington, D. C.

THE U. S. GOVERNMENT DOES NOT PAY FOR THIS ADVERTISEMENT. THE TREASURY DEPARTMENT THANKS, FOR THEIR PATRIOTIC DONATION, THE ADVERTISING COUNCIL AND THE DONOR ABOVE.

FIGURES are percentages of respondents to STEEL's quarterly survey.
COLOR shows how most respondents reported.

Cautious Metal Buyers Trim Stocks

But they build inventories of wide flange beams and heavy plates, still hard to get. With consumption down and money scarce, buying is geared to immediate needs

CONFIDENT they can get mill products as needed, metal buyers are waiting for needs to develop.

As one respondent to STEEL's quarterly survey puts it: "Inventory reduction is deliberate. Consumption is way off, and very little purchasing is contemplated, with the exception of wide flange shapes. On this item, we're still on allocation. But all indications are that the allocation can be stretched if additional material is wanted."

Structurals Ease — In STEEL's previous survey (Aug. 5, Page 137), 17 per cent of the buyers reported difficulty in obtaining structurals; now only 6 per cent have trouble. An Alabama firm says deliveries are still running four to six weeks late. A New Jersey fabricator reports that deliveries are

inadequate but improving.

Heavy plates, hard to obtain all year, continue to give buyers more trouble than any other product. In the last three months, however, the percentage of respondents complaining about plate deliveries has declined from 14 to 8. As a safeguard against future shortages, purchasing agents are keeping relatively heavy stocks of plates and structurals (see table). Satisfied with 30 to 60 day inventories in most cases, they maintain 60 to 90 day stocks of the hard-to-get items.

Production Cutbacks — Ninety days ago, none of the survey participants had enough copper or brass to last more than three months. Today, 9 per cent report such inventories. While it's possible that some buyers have added to their

stocks, taking advantage of low prices, it's just as likely that longer inventories result from slower consumption.

Aluminum inventories are conspicuously lower now than in recent months. One user in five reports less than 10 days' supply. Probable explanation: Fabricators won't tie up scarce money in a metal that's readily available.

Inventory Shakeups — Comparison of today's inventories with forecasts made three months ago shows that there has been less stability than buyers expected. In August, 70 per cent predicted fourth quarter stocks would be the same; 24 per cent were in the "lower" bracket, and 6 per cent in the "higher." Today, 46 per cent report inventories are unchanged from the August level; 39 per cent say they're lower, and 15 per cent say higher.

Current stocks of hot-rolled carbon bars are considered excessive by 8 per cent of the respondents;

7 per cent report higher than desired inventories of hot-rolled sheets and strip; 6 per cent have more plates than necessary, and 5 per cent say they're overloaded with structurals and seamless tubing.

If it weren't for occasional difficulties in obtaining certain plates and structurals, buyers would be unanimous in declaring that deliveries are satisfactory.

Forecast—Looking ahead to the first quarter of 1958, purchasing agents make these predictions: Six

out of 10 say inventories will be the same, three say they'll be lower, and one says higher.

Reduce Epoxy Compounds

Lower prices for development quantities of five epoxy compounds were announced last week by Becco Chemical Div., Food Machinery & Chemical Corp., Buffalo. The new prices: Octylene oxide, \$1.10 a pound; dodecene oxide, \$1.55; C₁₆-C₁₈ olefin oxide, \$1.55; dipentene monoxide, \$1.20; alpha-pinene

oxide, \$1.20. Prices include freight and the nonreturnable drum.

These recently introduced materials have many applications, including use as stabilizers for chlorinated compounds; as reactive solvents and diluents for epoxy resins; as intermediates in the preparation of surface-active agents, perfumeries, cosmetics, flavorings, pharmaceuticals, protective coatings, insecticides, bactericides, lubricant additives, adhesives, plasticizers and flotation agents; and as reactants in organic synthesis.

Stainless Steel . . .

Stainless Steel Prices, Page 181

A Pittsburgh area producer reports that sales of stainless steel plate for industrial equipment applications are declining. This market had been a mainstay of stainless sales earlier this year.

In other stainless products, an expected fourth quarter surge in demand for strip failed to develop, with sales to the auto builders slow. The quarter's volume is expected to be no better than that in third quarter.

Demand for stainless steel sheets is lagging badly. One producer says its orders are off fully 50 per cent from year-ago levels. Solid stainless plates are available for delivery in four weeks.

Sheets, Strip . . .

Sheet & Strip Prices, Pages 178 & 179

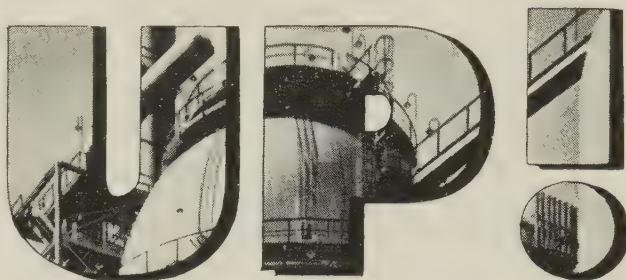

Sheet fabricators are operating at a fairly good rate, but with mill shipments of sheets readily available on short notice, they are not making any effort to build inventories. Actually, they are letting their stocks shrink, a situation that may continue.

Deliveries of hot-rolled sheets are available in two to three weeks, and cold rolled in three to four weeks. Galvanized sheets can be had virtually out of stock. Trading in specialties is spotty.

About the most that can be said for the sheet market is that it is having difficulty holding its own. Cold-rolled sheets seem to be in a little more active demand than hot rolled. Enameling stock and electrical sheets are showing little life.

High grade electrical sheets

HOW TO KEEP PRODUCTION

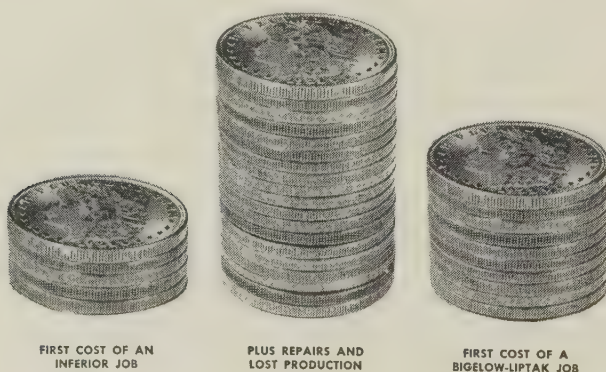

A few generations ago, John Ruskin had a few penetrating remarks to register on business—and what he said makes a lot of sense today.

"The common law of business practice," he commented, "prohibits paying a little and getting a lot. If you deal with the lowest bidder, it's well to add something for the risk you run. And if you do that, you will have enough left over for something better."

Let's translate this in terms of furnace construction for refineries. If you buy a heat enclosure for a job where high and continuous production is a must, then it's imperative that you invest in one that will stand the gaff. To make sure, you've got to build a unit which is properly engineered for the job it must do. You pay more, of course. But it's poor economy—and often embarrassing—to plow money back into repairs right at the peak of production.

That's all we have to say. You get sound engineering and a job designed to stay on stream when you come to Bigelow-Liptak. We've been designing refinery furnaces for years—erecting them, too. Both suspended and castable construction—the one that's best for the job—are used. Better investigate—right now!

BIGELOW-LIPTAK
CORPORATION

AND BIGELOW-LIPTAK EXPORT CORPORATION

13300 PURITAN AVENUE, DETROIT 27, MICHIGAN

UNIT-SUSPENDED WALLS AND ARCHES

have been fairly active the greater part of this year, but now they are in noticeably slower demand due to shrinking requirements for heavy electrical equipment.

Generally, sheet suppliers are dropping earlier predictions of an upturn in sales. With demand declining from several consuming areas, Pittsburgh mills say automotive tonnage, while up some, is not sufficiently heavy to add needed volume. Expectations are automotive requirements, based on present estimates, will be smaller in December than they were in October.

Steel Bars . . .

Bar Prices, Page 177

Hot carbon bar business is a shade better at some market centers, but most consumers are buying hand-to-mouth. They are having no difficulty getting tonnage for nearby delivery. Only an appreciable surge in requirements for their own finished products will cause bar consumers to step up specifications.

Suppliers of hot bars at Pittsburgh report October shipments are slightly heavier than those in September. But producers are predicting a sales decline during the closing two months of this quarter.

Farm equipment bar purchases have been better lately, but automotive buying still lacks zip.

Cold-drawn bar operations in New England are at 60 to 65 per cent of capacity. Converters are still drawing on hot bar inventories. Alloy bars are slow with defense volume slackening. Contrary to the general trend, stainless steel bar demand is up slightly, forging billets accounting for a fair share of the increase.

Tubular Goods . . .

Tubular Goods Prices, Page 181

The Youngstown Sheet & Tube Co. last week shipped the first carload of seamless oil well casing from its new No. 3 seamless mill at the Indiana Harbor Works, East Chicago, Ind. Two new seamless plants are now in production. A third will go into operation by the second quarter, 1958. The company also operates seamless mills at its Youngstown District Works.

Most tubular product makers

face declining sales in the remainder of the fourth quarter. Oil country tubing and line pipe, though, still are in strong demand.

Other tubular goods are subject to inventory reductions. Sales of butt weld pipe for housing applications are falling off rapidly. This is a seasonal development.

Users of mechanical tubing are cutting stocks, but sales of pressure tubing for boilers are firm, with a good backlog of unfilled orders, extending into 1958. Demand for pressure tubes from producers

of heat exchangers and condensers has fallen off. The outlook is for continued decline in November and December.

Wire . . .

Wire Prices, Pages 179 & 180

Mill schedules appear to be wide open on most wire products, with demand easy and deliveries prompt. Inquiry for merchant items is reported at a virtual standstill at some points.

A moderate increase in buying brought October bookings slightly

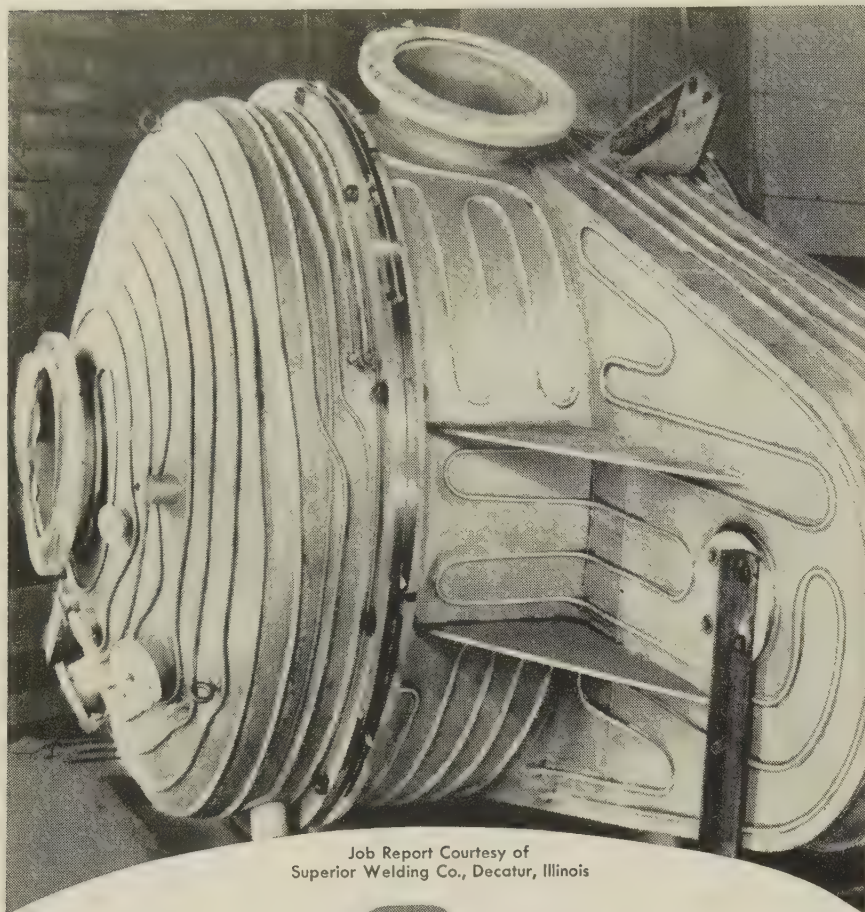

have greater resistance to open hearth slag. Their use helps increase melting capacity, and reduces cost per ton.

We guide our business on the principles of service and dependability.

WELD WITH

ARCOS

STAINLESS ELECTRODES

Shown here is a stainless steel furnace body of type 304 ELC for use under very high vacuum conditions in the casting of metals where exceptional purity is required. Arcos Chromend K-LC Stainless Electrodes were used because Arcos electrodes not only assured the proper weld metal chemistry, but also the necessary soundness to insure vacuum tight welds. Save money and future problems with long-lasting Arcos-produced welds. ARCOS CORPORATION, 1500 S. 50th Street, Philadelphia 43, Pa.

above the third quarter average in New England. But business added little to mill backlogs. Orders have been largely for prompt shipments. Incoming volume for November is slow.

Consumers' inventories are not heavy, but with prompt deliveries available on most products through the remainder of this year, anticipatory buying is being held to a minimum. Where users are subject to yearend inventory taxes, there is no desire to increase stocks.

Plates . . .

Plate Prices, Page 177

The keel for the first atomic-powered service ship, the cruiser *Long Beach*, will be laid at Bethlehem's Quincy, Mass., yard Dec. 2. General Electric's West Lynn, Mass., plant will build propulsion turbines, and Westinghouse Electric Corp., Pittsburgh, the atomic reactor.

Producers appear to be gradually getting caught up on commitments for heavy sheared plates, though one large eastern mill is still six weeks behind on deliveries. Supplies of light sheared plates are ample; strip-plates and universal plates are readily available.

Consumers are buying largely on a hand-to-mouth basis. In New England, tank and weldment shop backlogs are smaller, resulting in heavier plate inventories. Clad and semifabricated specialties are less active. Solid stainless plates are available in four weeks.

At Pittsburgh so-called "gray" market plate has disappeared; brokers are offering tonnage at close to mill levels. Reflecting the easier tone in the market, the Claymont Products Dept., Colorado Fuel & Iron Corp., Claymont, Del., has dropped premium prices on plain carbon plates and abrasive resistance plates, quoting \$5.10 and \$6.75. The reduction is \$12 a ton in each case.

Iron Ore . . .

Iron Ore Prices, Page 184

Shipments of Lake Superior iron ore totaled 2,356,184 gross tons in the week ended Oct. 28, reports the American Iron Ore Association. This compared with 2,771,274 tons moved in the like week last year.

Cumulative shipments to Oct. 28 are reported at 79,360,921 tons, against 65,771,733 to the same date in 1956.

Republic Steel Corp., Cleveland, has closed down its Fisher Hill mine at Mineville, N. Y. About 130 employees are affected. Two other mines of the company at Mineville are not affected.

Warehouse . . .

Warehouse Prices, Page 182

Sluggish demand for steel products at the mill level is being duplicated to large extent in the warehouse market. Distributors' volume is fair, but sellers see little change in prospect for November as contrasted with October.

Most distributors report fairly well balanced inventories. This even applies to wide flange sections and heavy plates. They hold ample supplies of standard shapes, light plates, and other major products. Sheets are readily available. So are bars.

Figures of a large Pacific Northwest jobber show its sales volume is down 20 per cent from what it was a year ago, but orders have increased (in number) by 30 per cent. It means buyers have been taking smaller tonnage, being more cautious with respect to inventories.

Little interest is noted in the Pacific Northwest in offerings of foreign steel. Some items imported months ago from Japan and Europe are still in area warehouses.

Pig Iron . . .

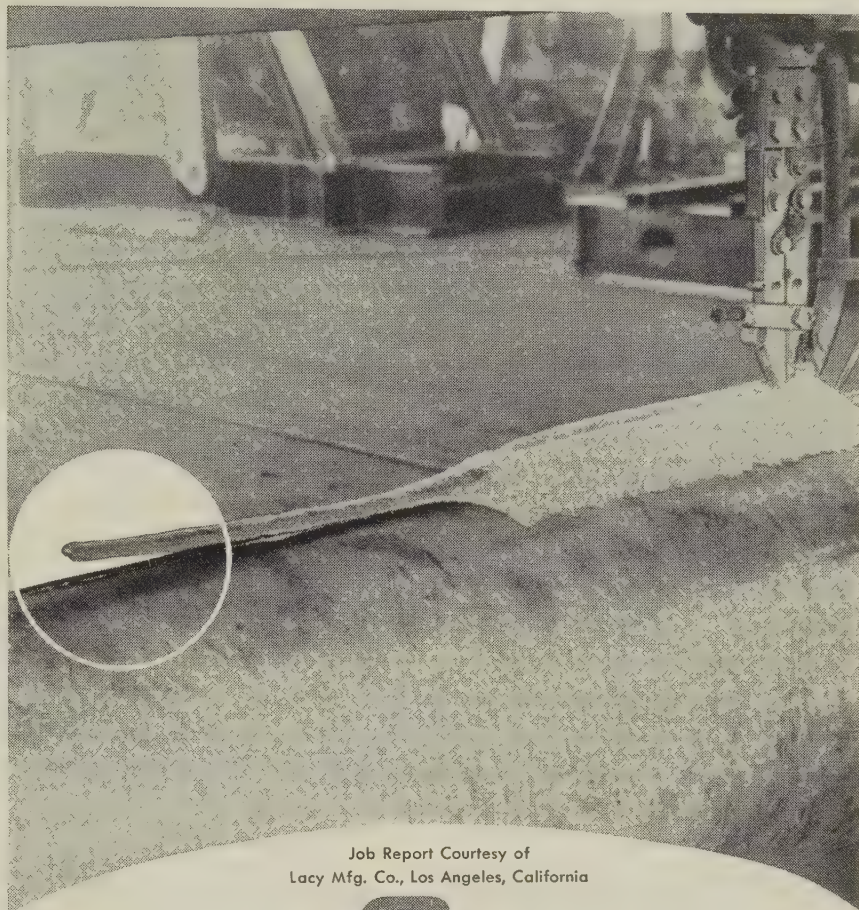

Pig Iron Prices, Page 182

The trend in merchant pig iron business continues downward. Sellers report a slight shrinkage in October (when usually the trend is up), and they expect further declines.

Lower building construction and reduced activity in the appliance industry are the principal causes for the reduced volume in the gray iron market. Demand for automotive castings is not up to expectations either.

Foundry operations are averaging less than four days a week. Gray iron shops are operating

Now, submerged arc stainless welds with slag that "pops-off"

Job Report Courtesy of
Lacy Mfg. Co., Los Angeles, California

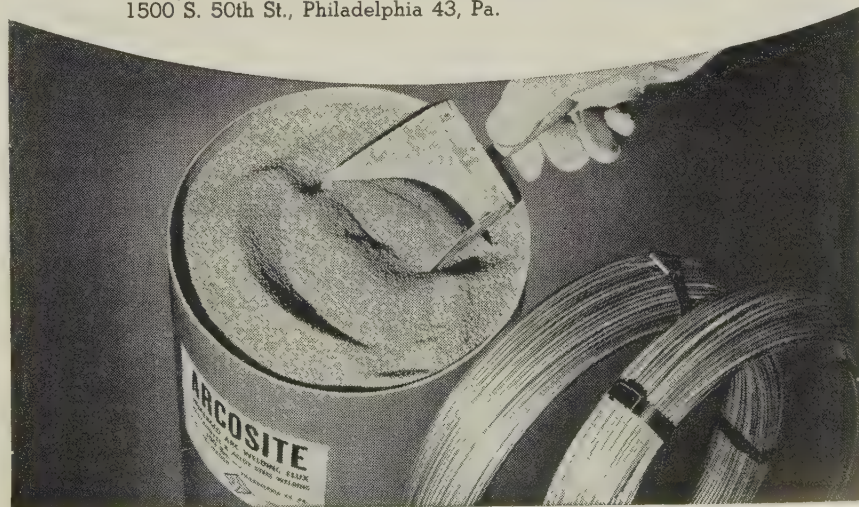

WELD WITH

ARCOS

Stainless Wire and Arcosite Flux

Arcos research and experience with stainless weld metal now pays you *another dividend*—for the first time... consistently *self removing slag*! On the job above, submerged arc welding of a section of pipe for petroleum equipment, two passes were made with $\frac{1}{8}$ " coiled CHROMENAR KMo Stainless Wire and ARCOSITE S-4 Flux. As the photo shows, the cooling slag is lifting free by itself... leaving a clean, smooth bead. Think what this can mean to you on your own submerged arc welding jobs... saving time and money... better welds than ever before. ARCOS CORPORATION, 1500 S. 50th St., Philadelphia 43, Pa.

about 60 per cent of normal; steel foundries a little better.

The iron market is further depressed by lack of export buying and by the drop in consumption of hot metal in steelmaking. With most steel mills operating their blast furnaces in excess of current requirements, iron is beginning to pile up.

U. S. Steel Corp. lighted a third blast furnace, *Patricia*, at its Fairless Works, Fairless Hills, Pa. This unit will increase the plant's iron-making capacity by 50 per cent. The furnace has a 28-ft hearth, and 1600-ton daily capacity.

Madeline No. 4 blast furnace of Inland Steel Co., East Chicago, Ind., down for relining since Oct. 1, will resume in early December with increased capacity. Its hearth is being increased to 20 ft 9 in. from 20 ft. Cutting down of the stack's thickness will increase its working volume by an estimated 50 tons a day.

No. 2 stack at the works underwent a similar enlargement earlier this year. Its hearth was increased from 19 ft to 19 ft 9 in.,

giving it a 5.7 per cent increase in working volume.

Structural Shapes . . .

Structural Shape Prices, Page 177

By the end of this year, it is thought most producers of wide flange structurals will be pretty well abreast of commitments on most sizes. They are already caught up on standard sections.

The improved supply position in plain material reflects, in part, tapering off in structural demand, especially industrial and commercial work.

In the East, several sizable jobs are pending. Bids have been opened on 17,500 tons of shapes and 4000 tons of cable for a suspension bridge and approaches at Throgg's Neck, New York, for the Triboro Bridge & Tunnel Authority. This job will eventually require 52,500 tons of shapes and miscellaneous steel.

More New York state bridge work is coming up for figures also, and there are several miscellaneous building jobs of good size pending,

including a 7000-ton powerplant in Astoria, N. Y.

Only demand for educational buildings is holding up at earlier levels in New England. This class of construction takes a minimum volume of wide flange sections. Industrial and commercial estimating is lower in the area, and active district bridge volume involves under 2000 tons. Vermont takes bids next spring on 8360 tons, but plans for 1958 bridge programs lag in other northeast states. American Bridge Div., U. S. Steel Corp., Pittsburgh, booked 6200 tons for the Connecticut River bridge at Glastonbury, Conn.

With mill shipments of shapes improving steadily at Pittsburgh, construction firms are expected to cut their inventories between now and yearend. Bridge builders in the area expect brisk business next year.

West coast fabricators are bidding on a series of highway and school projects that were held up last summer because of strikes. Bidding is brisk. Fabricators in the Pacific Northwest are seeking new work with current backlogs barely extending beyond this quarter.

52,500 tons, Throggs Neck bridge, between Bronx and Queens, Triboro Bridge & Tunnel Authority, New York, pending; 17,500 tons for towers and anchorages, Bethlehem Steel Co., Bethlehem, Pa., low bidder (about 7000 tons will be used for the tower piers, on the construction of which Merritt-Chapman & Scott Corp., New York, is low bidder); 4000 tons for cables and hangars, American Bridge Div., U. S. Steel Corp., Pittsburgh, low bidder; award of these contracts is expected shortly, leaving about 31,000 tons of shapes and miscellaneous requirements to be asked for later; bids for the bridge deck will probably be asked late this year and for the approach work, early next year; over-all, the project will require 32,500 tons of shapes and miscellaneous steel for the main suspension bridge and 20,000 tons for the approaches; Ammann & Whitney, New York, is designer of the bridge, and E. Lionel Pavlo, New York, is designer of the approaches.
 8500 tons, plate girder approaches, and superstructures, truss span bridge, superstructures, Missouri River, Boone and Cooper counties, Mo., to Stupp Bros. Bridge & Iron Co., St. Louis.
 8360 tons, state highway bridges, Vermont; sites under inspection preliminary to openings for steel contracts in the spring; included are 3000 tons, concrete reinforcing bars.
 7000 tons, powerplant, unit No. 4, Astoria, for Consolidated Edison Co. of New York Inc., New York; bids Nov. 8.
 3000 tons, race track, Monticello Racing Co., Sullivan County, N. Y.
 2900 tons, Chrystie Street subway section, Transit Authority, lower Manhattan, New York, through Cayuga Foundation, general contractor, to Grand Iron Works, New York (Bronx).
 2650 tons, comprising two office units of 1400 and 1250 tons, respectively, Prudential Insurance Co. of America Inc., Newark, N. J., bids closed Oct. 29; this is in addition to two units let some time ago.
 2150 tons, two Jesse Secoles apartments, Third Avenue, New York (Manhattan), to Dreier Structural Steel Co. Inc., New York (Queens).
 2000 tons, Kleban office building, 410 Park Ave., New York; bids asked.
 1900 tons, state bridge work, Onondaga County, N. Y., Bero Construction Co., Waterloo, N. Y., low on general contract.

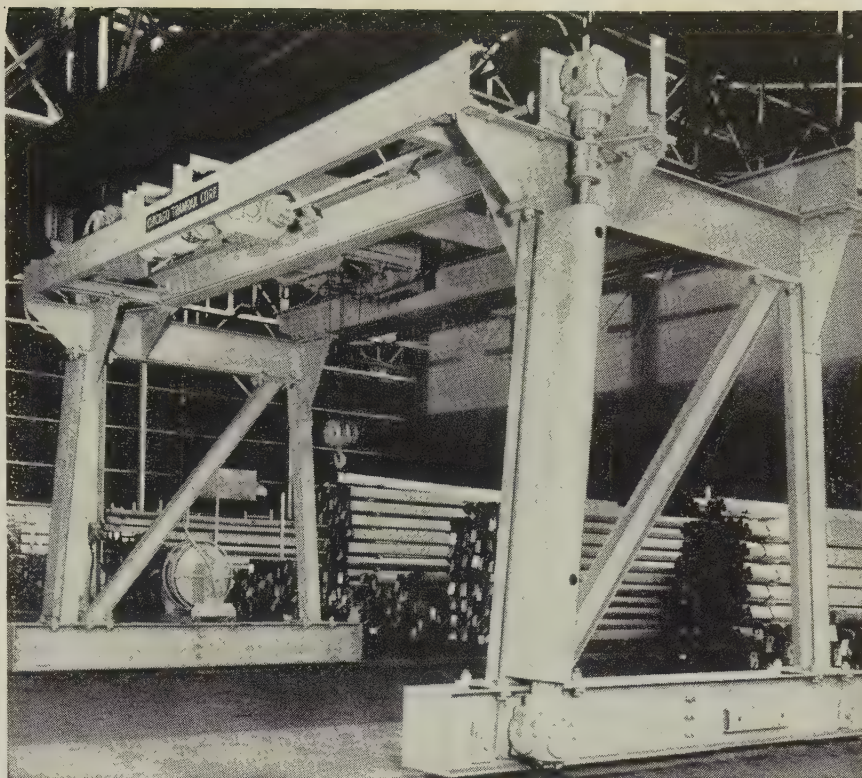

PLATES . . .

PLATES PLACED

650 tons, tanks, Waterworks Department, Lafayette, Ind., to Chicago Bridge & Iron Co., Chicago.
 295 tons, General Stores Supply Office, Navy, Philadelphia, to Columbia-Geneva Div., U. S. Steel Corp., San Francisco.
 265 tons, heat treated, Navy Purchasing Office, Washington, D. C., to Lukens Steel Co., Coatesville, Pa.
 240 tons, General Stores Supply Office, Navy, Philadelphia, to Columbia-Geneva Div., U. S. Steel Corp., San Francisco.
 225 tons, General Stores Supply Office, Navy, Philadelphia, to Bethlehem Steel Co., Bethlehem, Pa.
 200 tons, grade 2, Watertown (Mass.) Arsenal, to the Bethlehem Steel Co., Bethlehem, Pa.
 155 tons, 500,000-gal elevated water tank, Flint, Mich., to Pittsburgh-Des Moines Steel Co., Pittsburgh.
 135 tons, water tank, Franklin, La., to Hammond Iron Works, Warren, Pa.
 125 tons, standpipe, Canton, Mass., to Pittsburgh-Des Moines Steel Co., Pittsburgh.

PLATES PENDING

1100 tons, four oil storage tanks Gulf Oil Co., Pittsburgh; bids asked.

CHICAGO TRAMRAIL

GANTRY CRANES

At the modern plant of one of the country's largest aluminum companies, Chicago Tramrail Gantry Cranes handle long extruded pieces from a 14,000-ton extrusion press . . . transfer these pieces to other operations throughout the mill.

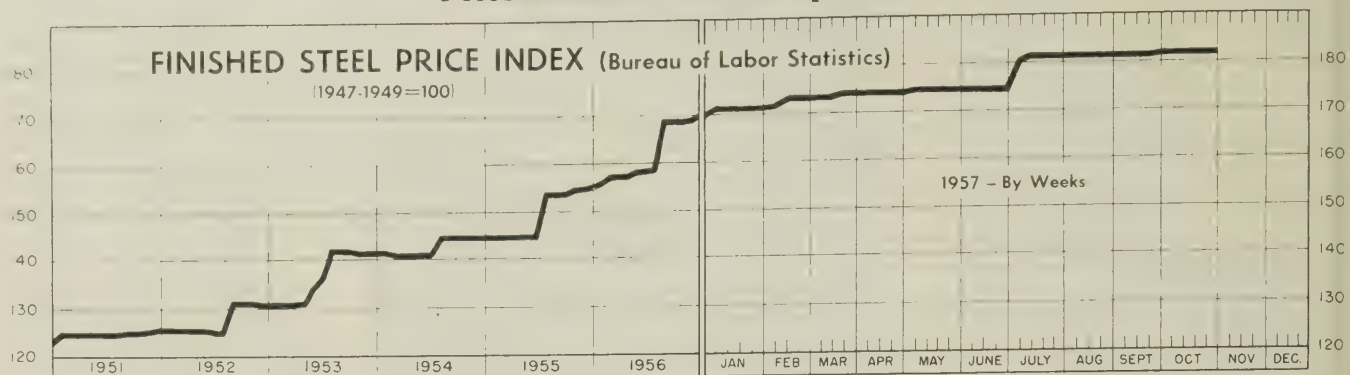

Fourteen Chicago Tramrail Full Gantry Cranes provide individual handling equipment for individual operations to eliminate waste time waiting for busy overhead cranes. Designed for heavy-duty, continuous service, these Gantries are built with maximum headroom and maximum clearance between legs to operate independently under the large overhead cranes.

For a practical, economical solution to your materials handling problems, see our experienced engineers. Special designs, sound engineering and broad application knowledge qualify us for helpful service.

WANTED

thoroughly experienced SHIP ESTIMATORS

Immediate openings for thoroughly experienced ship estimators are now available at The INGALLS Shipbuilding Corporation's Gulf Coast yard at Pascagoula, Mississippi.

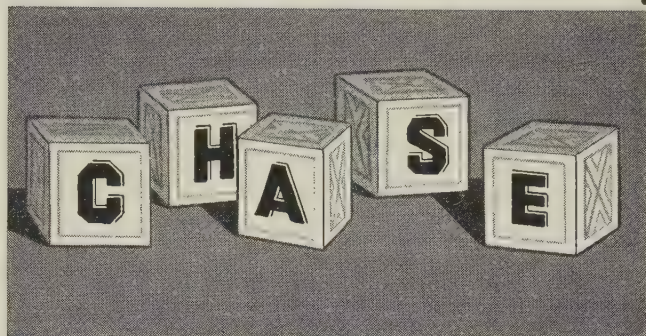

Here, the cost of living is lower than in big cities! And you'll like the pleasant Gulf climate, the excellent living and recreational facilities.

If you are thoroughly experienced in estimating ship work... if you are ready to meet a new challenge... if you would like to start working now for one of the largest shipyards in America, where there is a backlog of work for years to come... write immediately to W. R. Guest, Sr., President, or Jack Gray, Chief Estimator, The INGALLS Shipbuilding Corporation, Pascagoula, Mississippi.

ELECTRIC FURNACE

STEEL CASTINGS

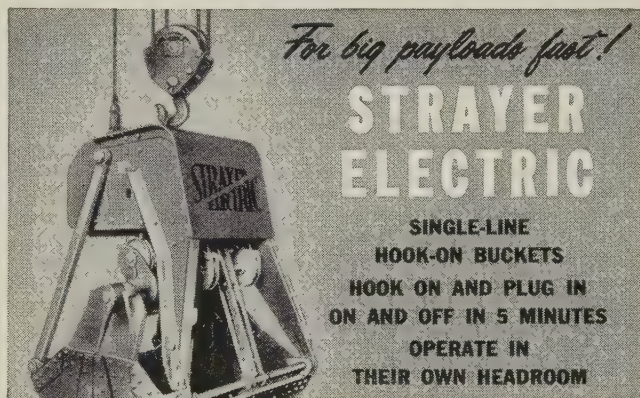

**CARBON-ALLOY-STAINLESS
SAND OR SHELL MOLDED**

"C" Steel Castings—sand or shell molded—possess qualities far more interesting than the mere strength of steel. For, in addition to strength they provide more efficient design—better weight-strength ratio—and greater fatigue resistance, i.e., longer life and less replacement. Furthermore "C" Steel Castings, because they are truly foundry engineered from pattern to final casting, require minimum machining and provide better fit plus fast assembly.

If you are interested in castings the know-how, experience and engineering knowledge of our staff are at your service upon request.

Crucible Steel Casting Co.

7 Good Reasons Why
Strayer Electrics Deliver

GREAT CLOSING POWER: Strayer Electric motor driven, combination block and tackle and lever arm action.

DUMPS FULL PAYLOADS: No stiffening plates or braces to collect material.

LONGER CABLE LIFE: Full wrap reeving. No backlash.

NO SIFT-OUT: Positive scoop alignment.

POSITIVE CONTROL: Dig or Dump as much as you like.

COMPLETELY SAFE: Fool-proof power brake.

FAST PARTS SERVICE: Power unit made of standard catalog parts. Quick delivery.

Ferroalloys

MANGANESE ALLOYS

Spiegeleisen: Carlot, per gross ton, Palmerton, Pa. 21-23% Mn, \$105; 19-21% Mn, 1-3% Si, \$103.50; 16-19% Mn, \$100.50.

Standard Ferromanganese: (Mn 74-76%, C 7% approx). Base price per net ton, \$245, Johnstown, Duquesne, Sheridan, Pa.; Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. Add or subtract \$2 for each 1% or fraction thereof of contained manganese over 76% or under 74% respectively.

(Mn 79-81%). Lump \$263 per net ton, f.o.b. Anaconda or Great Falls, Mont. Add \$2.60 for each 1% above 81%; subtract \$2.60 for each 1% below 79%, fractions in proportion to nearest 0.1%.

High-Grade Low-Carbon Ferromanganese: (Mn 85-90%). Carload, lump, bulk, max 0.07% C, 35.1c per lb of contained Mn, carload packed 36.4c, ton lots 37.9c, less ton 39.1c. Delivered. Deduct 1.5c for max 0.15% C grade from above prices, 3c for max 0.03% C, 3.5c for max 0.50% C, and 6.5c for max 75% C—max 7% Si. **Special Grade:** (Mn 90% min, C 0.07% max, P 0.06% max). Add 2.05c to the above prices. Spot, add 0.25c.

Medium-Carbon Ferromanganese: (Mn 80-85%, C 1.25-1.5%, Si 1.5% max). Carload, lump, bulk, 25.5c per lb of contained Mn, packed, carload 26.8c, ton lot 28.4c, less ton 29.6c. Delivered. Spot, add 0.25c.

Manganese Metal: 2" x D (Mn 95.5% min, Fe 2% max, Si 1% max, C 0.2%). Carload, lump, bulk, 45c per lb of metal; packed, 45.75c; ton lot 47.25c; less ton lot 49.25c. Delivered. Spot, add 2c.

Electrolytic Manganese Metal: Min carload, 34c; 2000 lb to min carload, 36c; 500 lb to 1999 lb, 38c; 50 lb cans, add 0.5c per lb. Premium for hydrogen-removed metal, 0.75c per lb. Prices are f.o.b. cars, Knoxville, Tenn., freight allowed to St. Louis, any point east of Mississippi; or f.o.b. Marietta, O., freight allowed.

Silicomanganese: (Mn 65-68%). Contract, lump, bulk 1.50% C grade, 18-20% Si, 12.8c per lb of alloy. Packed, c.l. 14c, ton 14.45c, less ton 15.45c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. For 2% C grade, Si 15-17%, deduct 0.2c from above prices. For 3% C grade Si 12-14.5%, deduct 0.4c from above prices. Spot, add 0.25c.

TITANIUM ALLOYS

Ferrotitanium, Low-Carbon: (Ti 20-25%, Al 3.5% max, Si 4% max, C 0.10% max). Contract, ton lot, 2" x D, \$1.50 per lb of contained Ti; less ton \$1.55, (Ti 38-43%, Al 8% max, Si 4% max, C 0.10% max). Ton lot \$1.35, less ton \$1.37, f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis. Spot, add 5c.

Ferrotitanium, High-Carbon: (Ti 15-18%, C 6-8%). Contract \$200 per ton, f.o.b. Niagara Falls, N. Y., freight allowed to destinations east of Mississippi River and north of Baltimore and St. Louis.

Ferrotitanium, Medium-Carbon: (Ti 17-21%, C 2-4.5%). Contract \$225 per ton, f.o.b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed.

CHROMIUM ALLOYS

High-Carbon Ferrochrome: Contract, c.l. lump, bulk 28.75c per lb of contained Cr; c.l. packed 30.30c, ton lot 32.05c; less ton 33.45c. Delivered. Spot, add 0.25c.

Low-Carbon Ferrochrome: Cr 63-66% (Simplex), carload, lump, bulk, C 0.025% max, 36.75c per lb contained Cr; 0.010% max, 37.75c. Ton lot, add 3.5c; less ton, add 5.2c. Delivered. Cr 67.71%, carload, lump, bulk, C 0.02% max, 41.00c per lb contained Cr; 0.025% max, 39.75c; 0.05% max, 39.00c; 0.10% max, 38.50c; 0.20% max, 38.25c; 0.50% max, 38.00c; 1.0% max, 37.75c; 1.5% max, 37.50c; 2.0% max, 37.25c. Ton lot, add 3.4c; less ton lot, add 5.1c. Delivered.

Foundry Ferrochrome, High-Carbon: (Cr 62-66%, C 5-7%, Si 7-10%). Contract, c.l. 2 in. x D, bulk 30.05c per lb of contained Cr. Packed, c.l. 31.65c, ton 33.45c, less ton 34.95c. Delivered. Spot, add 0.25c.

Foundry Ferrosilicon Chrome: (Cr 50-54%, Si 28-32%, C 1.25% max). Contract, carload, packed, 8M x D, 21.25c, per lb of alloy, ton lot 22.50c; less ton lot 23.70c. Delivered. Spot, add 0.25c.

Ferrochrome-Silicon: Cr 39-41%, Si 42-45%, C 0.05% max or Cr 33-36%, Si 45-48%, C 0.05% max. Carload, lump, bulk, 3" x down and 2" x down, 27.50c per lb contained Cr, 14.20c per lb contained Si, 0.75" x down, 28.65c per lb contained Cr, 14.20c per lb contained Si. Delivered.

Chromium Metal Electrolytic: Commercial grade (Cr 99.8% min, metallic basis, Fe 0.2% max). Contract, carlot, packed 2" x D plate (about 1/8" thick) \$1.29 per lb, ton lot \$1.31, less ton lot \$1.33. Delivered. Spot, add 5c.

VANADIUM ALLOYS

Ferrovanadium: Open-hearth grade (V 50-55%, Si 8% max, C 3% max). Contract, any quantity, \$3.20 per lb of contained V. Delivered. Spot, add 10c. **Special Grade:** (V 50-55% or 70-75%, Si 2% max, C 0.5% max) \$3.30. **High Speed Grade:** (V 50-55%, or 70-75%, Si 1.50% max, C 0.20% max) \$3.40.

Grainal: Vanadium Grainal No. 1 \$1.05 per lb; No. 6, 68c; No. 79, 50c, freight allowed.

Vanadium Oxide: Contract less carload lot, packed \$1.38 per lb contained V₂O₅, freight allowed. Spot, add 5c.

SILICON ALLOYS

25-36% Ferrosilicon: Contract, carload, lump, bulk, 20.0c per lb of contained Si. Packed 21.40c; ton lot 22.50c, f.o.b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed.

50% Ferrosilicon: Contract, carload, lump, bulk, 14.20c per lb of contained Si. Packed c.l. 16.70c, ton lot 18.15c, less ton 19.80c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. Spot, add 0.45c.

Low-Aluminum 50% Ferrosilicon: (Al 0.40% max). Add 1.45c to 50% ferrosilicon prices.

65% Ferrosilicon: Contract, carload, lump, bulk, 15.25c per lb contained silicon. Packed, c.l. 17.25c, ton lot 19.05c; less ton 20.4c. Delivered. Spot, add 0.35c.

75% Ferrosilicon: Contract, carload, lump, bulk, 16.4c per lb of contained Si. Packed, c.l. 18.30c, ton lot 19.95c, less ton 21.2c. Delivered. Spot, add 0.3c.

90% Ferrosilicon: Contract, carload, lump, bulk, 19.5c per lb of contained Si. Packed, c.l. 21.15c, ton lot 22.55c, less ton 23.6c. Delivered. Spot, add 0.25c.

Silicon Metal: (98% min Si, 0.75% max Fe, 0.07% max Ca). C.l. lump, bulk, 22.00c per lb of Si. Packed, c.l. 23.65c, ton lot 24.95c, less ton 25.95c. Add 0.5c for max 0.03% Ca grade. Deduct 0.5c for max 1% Fe grade analyzing min 99.75% Si; 0.75c for max 1.25% Fe grades analyzing min 96.75% Si. Spot, add 0.25c.

Alsifer: (Approx 20% Al, 40% Si, 40% Fe). Contract, basis f.o.b. Niagara Falls, N. Y., lump, carload, bulk, 10.65c per lb of alloy; ton lot, packed, 11.8c.

ZIRCONIUM ALLOYS

12-15% Zirconium Alloy: (Zr 12-15%, Si 39-43%, C 0.20% max). Contract, c.l. lump, bulk 9.25c per lb of alloy. Packed, c.l. 10.45c, ton lot 11.6c, less ton 12.45c. Delivered. Spot, add 0.25c.

35-40% Zirconium Alloy: (Zr 35-40%, Si 47-52%, Fe 8-12%, C 0.50% max). Contract, carload, lump, packed 27.25c per lb of alloy, ton lot 28.4c, less ton 29.65c. Freight allowed. Spot, add 0.25c.

BORON ALLOYS

Ferroboron: (B 17.50% min, Si 1.50% max, Al 0.50% max, C 0.50% max). Contract, 100 lb or more 1" x D, \$1.20 per lb of alloy; less than 100 lb \$1.30. Delivered. Spot, add 5c. F.o.b. Washington, Pa., prices, 100 lb and over, are as follows: Grade A (10-14% B) 85c per lb; Grade B (14-18% B) \$1.20; Grade C (19% min B) \$1.50.

Borosil: (3 to 4% B, 40 to 45% Si). Carload, bulk, lump, or 3" x D, \$5.25 per lb of contained B. Packed, carload \$5.40, ton to c.l. \$5.50, less ton \$5.60. Delivered.

Bortam: (B 1.5-1.9%). Ton lot, 45c per lb; less than ton lot, 50c per lb.

Carbortam: (1 to 2%). Contract, lump, carload 9.50c, per lb f.o.b. Suspension Bridge, N. Y., freight allowed same as high-carbon ferrotitanium.

CALCIUM ALLOYS

Calcium-Manganese-Silicon: (Ca 16-20%, Mn 14-18% and Si 53-59%). Contract, carload, lump, bulk 23c per lb of alloy, carload packed 24.25c, ton lot 26.15c, less ton 27.15c. Delivered. Spot, add 0.25c.

Calcium-Silicon: (Ca 30-33%, Si 60-65%, Mn 1.5-3%). Contract, carload, lump, bulk 2c per lb of alloy, carload packed 25.65c, ton lot 27.95c, less ton 29.45c. Delivered. Spot, add 0.25c.

BRIQUETTED ALLOYS

Chromium Briquets: (Weighing approx 3 1/2 lb each and containing 2 lb of Cr). Contract, carload, bulk 19.60c per lb of briquet, carload packed in box pallets 19.80c, in bags 20.70c; 3000 lb to c.l. in box pallets 21.00c, 2000 lb to c.l. in bags, 21.90c; less than 2000 lb in bags 22.80c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Ferromanganese Briquets: (Weighing approx 3 lb and containing 2 lb of Mn). Contract, carload, bulk 14.8c per lb of briquet; c.l. packed, pallets 15c, bags 16c; 3000 lb to c.l. pallets 16.2c; 2000 lb to c.l. bags, 17.2c; less ton 18.1c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicomanganese Briquets: (Weighing approx 3 1/2 lb and containing 2 lb of Mn and approx 1/2 lb of Si). Contract, c.l. bulk 15.1c per lb of briquet; c.l. packed, pallets, 15.3c; bags 16.3c, 3000 lb to c.l., pallets, 16.5c; 2000 lb to c.l., bags 17.5c; less ton 18.4c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicon Briquets: (Large size—weighing approx 5 lb and containing 2 lb of Si). Contract, carload, bulk 7.7c per lb of briquet; c.l. packed, pallets, 7.9c; bags 8.9c; 3000 lb to c.l., pallets 9.5c; 2000 lb to c.l. bags 10.5c; less ton 11.4c. Delivered. Spot, add 0.25c. (Small size—weighing approx 2 1/2 lb and containing 1 lb of Si). Carload, bulk 7.85c. Packed, pallets 8.05c; bags 9.05c; 3000 lb to c.l. pallets 9.65c; 2000 lb to c.l. bags 10.65c; less ton 11.55c. Delivered. Add 0.25c for notching, small size only. Spot, add 0.25c.

Molybdenic-Oxide Briquets: (Containing 2 1/2 lb of Mo each). \$1.41 per pound of Mo contained, f.o.b. Langeloth, Pa.

TUNGSTEN ALLOYS

Ferrotungsten: (70-80%), 5000 lb W or more \$2.95 per lb of contained W; 2000 lb W to 5000 lb W, \$3.05; less than 2000 lb W, \$3.17. Delivered.

OTHER FERROALLOYS

Ferrocolumbium: (Cb 50-60%, Si 8% max, C 0.4% max). Contract, ton lot 2" x D, \$4.90 per lb of contained Cb. Delivered. Spot, add 10c.

Ferrotantalum—Columbium: (Cb 40% approx, Ta 20% approx, and Cb plus Ta 60% min, C 0.30% max). Ton lot 2" x D, \$4.25 per lb of contained Cb plus Ta, delivered; less ton lot \$4.30.

SMZ Alloy: (Si 60-65%, Mn 5-7%, Zr 5.7%, Fe 20% approx). Contract, c.l. packed 1/2-in. x 12 M 20.00c per lb of alloy, ton lot 21.15c, less ton 22.40c. Delivered. Spot, add 0.25c.

Graphidox No. 5: (Si 48-52%, Ca 5-7%, Ti 9-11%). C.l. packed, 19c per lb of alloy, ton lot 20.15c; less ton lot 21.4c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

V-5 Foundry Alloy: (Cr 38-42%, Si 17-19%, Mn 8-11%). C.l. packed 18.1c per lb of alloy; ton lot 19.55c; less ton lot 20.8c, f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis.

Simanal: (Approx 20% each Si, Mn, Al; bal Fe). Lump, carload, bulk 18.50c. Packed c.l. 19.50c, 2000 lb to c.l. 20.50c, less than 2000 lb 21c per lb of alloy. Delivered.

Ferrophosphorus: (23-25% based on 24% P content with unitage of \$4 for each 1% of P above or below the base); carload, f.o.b. sellers' works, Mt. Pleasant, Siglo, Tenn., \$110 per gross ton.

Ferromolybdenum: (55-75%). Per lb of contained Mo, in 200-lb container, f.o.b. Langeloth and Washington, Pa. \$1.68 in all sizes except powdered which is \$1.74.

Technical Molybdenic-Oxide: Per lb of contained Mo, in cans, \$1.39; in bags, \$1.38, f.o.b. Langeloth and Washington, Pa.

INTRODUCTION TO THE STUDY OF HEAT TREATMENT OF METALLURGICAL PRODUCTS

By Albert Portevin

Fundamental knowledge and essential principles of heat treatment of steel are presented in simple and understandable manner. Research engineers, metallurgical students and steel plant metallurgists engaged in metallurgical investigations and the heat treatment of ferrous and non-ferrous metals will find this book of inestimable value.

ARE YOU OFFERING A SERVICE?

If your company performs plating, galvanizing, finishing or any one of dozens of metalworking operations on a contract basis, you can attract new customers by inserting an advertisement in the classified pages of **STEEL**.

Downswing in Scrap Is Unchecked

Prices register further decline as consumers stay on sidelines and material begins to pile up in yards. STEEL's composite on the prime grade drops to \$35.33, off another \$1.50 a ton

Scrap Prices, Page 190

Philadelphia—Further weakness is noted in domestic scrap prices. Prime grades of open-hearth material are lower at \$36.50, delivered, on light buying. Prices on the secondary grades are unchanged. Electric furnace bundles are off \$1 at \$44, and heavy turnings are also down \$1 at \$32.50. Low phos structurals and plates are easier at \$45-\$47, and railroad specialties are nominally lower at \$54 for couplers, spring and wheels, and \$66-\$67 for rail crops, 2 ft and under. No. 1 cupola and heavy breakable cast are lower at \$41.

Contributing to the weaker tone is an easing in export demand. One cargo vessel of steel scrap is being loaded here, and another is scheduled to be loaded within a

week or so, but beyond that, nothing is in prospect for shipment from this port in the foreseeable future.

The Pennsylvania Railroad will close Nov. 5 on 18,465 net tons of ferrous scrap, including 3500 tons of No. 1 heavy melting steel, 3800 tons of No. 1 rerolling rail, and 2500 tons of steel cars, cut to load.

New York—Brokers again have reduced buying prices on most grades, with domestic consumer buying slow, export demand off, and yard stocks accumulating.

Prices on No. 1 heavy melting and No. 1 bundles are now \$34-\$35, and on No. 2 heavy melting, \$29-\$30. Only No. 2 bundles, of the major open hearth grades, are unchanged.

Machine shop turnings are lower

at \$11-\$12, mixed borings and turnings are \$13-\$14, short shoveling turnings are \$15-\$16, and low phos structurals and plate, \$45-\$46. Heavy breakable cast is down \$1 at \$33-\$34.

With consumption slack, prices on nickel bearing stainless steel scrap have dipped sharply. Brokers are offering no more than \$165-\$175 for 18-8 sheets, clips, and solids, a drop of \$10 a ton. On 18-8 borings and turnings they are offering \$55-\$60, down \$20 a ton. Prices on the straight chromium grades are unchanged.

Boston — Heavy melting steel scrap prices are lower. Brokers are paying \$27-\$28 for No. 1 heavy melting, shipping point, but buying is sluggish. No. 2 steel bundles are off \$5 a ton to \$19-\$20, shipping point. Cast iron prices are for the most part nominal, with buying at a minimum.

Chicago—Few sales are reported. The market continues to sag, though less drastically than it has in recent weeks. In most cases price declines of \$1 to \$2 a ton are noted. Only rerolling rail and axles dipped as much as \$3.

Mark of quality in STAINLESS STEEL too!

STEELMAKING SCRAP PRICE COMPOSITE

Based on No. 1 heavy melting grade at Pittsburgh, Chicago, and eastern Pennsylvania—Compiled by STEEL

Brokers and dealers are not pushing for sales, apparently being content to sit tight in hope of an upturn in demand and improved prices. Consumers hold substantial inventories and are not actively increasing their holdings.

Pittsburgh—Bids closing soon for railroad and industrial scrap will give a clearer indication of the local market's position than has been discernible for several weeks. Prices continued to drop an average of \$2 a ton last week, based on brokers' estimates in the absence of mill buying. Market observers doubt the decline has ended, but they say it is difficult to buy large tonnage at current quotations.

Cleveland — Automotive scrap lists are closing on bids averaging under \$31 on No. 1 factory bundles. Large tonnages are involved, one lot totaling 15,000 tons. As a result of the lower prices on factory scrap, quotations on steel grades generally are off another \$2, with No. 1 heavy melting \$30-\$31. All prices are nominal in the absence of representative buying by consumers. Prices on railroad scrap are unchanged, but quotations are nominal. Small railroad lists are expected to be out this week.

Youngstown—A further decline in the nominal prices quoted is expected here. Dealers see no early end of the current slump in their market. Material is piling up in yards and at steel plants. Local sellers can't ship into adjacent

consuming markets because of a \$4 to \$5 a ton freight disadvantage.

Buffalo—Prices continue on the downside, but lists are largely nominal in the absence of new orders. Dealers anticipate a further drop when November mill contracts are placed. Prices already are down \$2 from early October levels.

If the market continues under pressure, dealers say No. 1 heavy melting will likely fall to a range of \$32-\$33 this month. No. 2 grades, though, are not expected to decline as sharply.

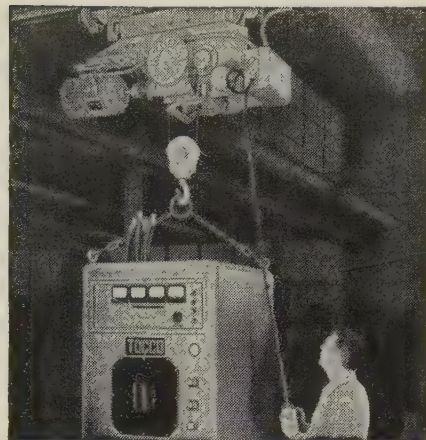

Cupola cast has been reduced \$1 to a range of \$42-\$43.

Detroit — Prices have moved down several dollars, but no new buying is reported here, except for a few orders from outside the area. The general feeling is that scrap will hold about at present levels, possibly a bit lower, until December. The outcome of bids on month-end automotive lists is awaited.

Cincinnati—Prices on the principal grades are off another \$3 a ton. No. 1 heavy melting is \$33-\$34. Weakness has spread through the entire scrap list, with railroad steel grades dropping \$3 to \$5 a ton.

Birmingham—Buying of scrap is hand-to-mouth here. Cast iron consumers are taking some tonnage, but only enough to maintain inventories. Open hearth and elec-

*Everybody profits
...because
you
belong
in this
picture!*

The publisher of this magazine is often asked what kind of a man you are ... and how many like you are receiving his magazine. Why is he asked?

Because the *advertisers* (whose money is his chief income) insist upon knowing the types of people (by industry or profession, by title) for whom the magazine is edited — and how many are getting it.

In order to standardize on the presentation of such information to advertisers and to have its accuracy vouched for by a disinterested third party, nearly 450 publishers have joined some 200 leading advertisers and advertising agencies in a non-profit organization called Business Publications Audit.

The purpose of BPA is to assure advertisers ... by frequently checking and rechecking ... that each member publisher is indeed distributing his magazine, in the *numbers* promised, to the *types* of men he promised would receive it.

The BPA symbol in this magazine means that *you belong* ... that because of your occupational interests you are qualified, in the eyes of the advertisers, to receive it.

The advertiser can thus tell whether he's getting his money's worth.

The publisher has a better sales story to prospective advertisers because his magazine is "audited."

And you, the reader, get more value from the magazine because both the advertisers and editors, knowing what your special occupation is and what your interests are, are better able to prepare advertising and editorial material that will be most informative and useful to you.

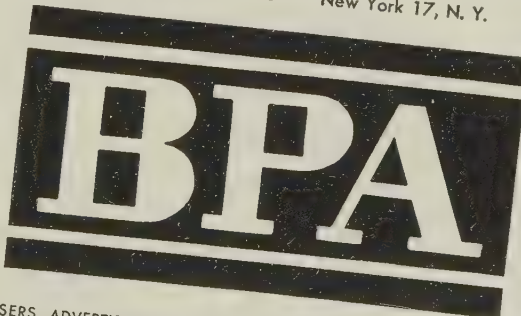

What you can do

Publishers and advertisers frequently write to magazine readers to learn what kind of articles and advertisements appeal most. Cooperate with them — will you? — by answering their questions ... in the interest of better communications between makers and markets.

Stockpile Probe To Start

ODM's Gray appoints committee to re-evaluate stockpile requirements in "nuclear age." Third quarter earnings off. Availability of nickel reported to be at all-time high

Nonferrous Metal Prices, Pages 194 & 195

THE GOVERNMENT will take a long look at its strategic stockpile program through a nonpartisan committee.

Gordon Gray, director of the Office of Defense Mobilization, is expected to name the 12-man group momentarily. The odds are it will be composed of people with an intimate knowledge of the program but who haven't "any axes to grind." One Washington source reports the committee chairman and chief assistant have been working behind closed doors at the ODM for at least the last two or three weeks. It tends to back up Mr. Gray's statement that a report could be ready by yearend.

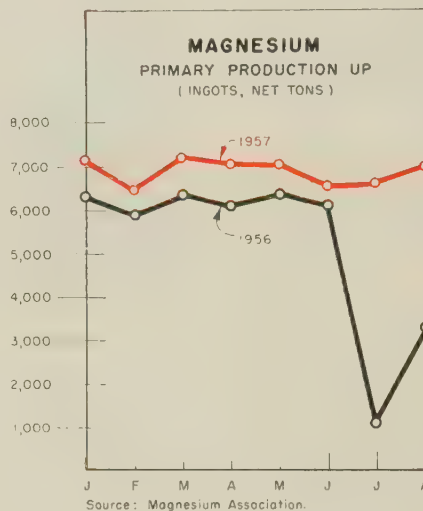

Originally, the stockpile was set up to provide an emergency source of strategic metals in case of war. But the program has come under increased attack from some Congressional leaders who question its value in the "nuclear age." Some, like Sen. A. Willis Robertson (D., Va.), chairman of the Joint Defense Production Committee, have long advocated disposal of unneeded metal.

Problem—The stockpile question is a political hot potato. If the committee proposes its continuation, look for noise from Capitol Hill. But disposal of any part of the stockpile would require Congressional action, and it seems certain that Democrats and Republicans from the mining states would fight any such action.

Lead and zinc would be most seriously affected by any change in the program. (Average monthly shipments of lead to stockpile this year are estimated at about 8000 tons, zinc at around 12,000 tons.) A STEEL check of leading producers finds little worry about the government dumping metal on the open market. "It would destroy the domestic price," says one

executive, "and the government knows it."

Outlook—There are differences of opinion inside the industry, though, on whether the program itself will be discontinued. Says one observer: "The committee's recom-

mendations will probably just gather dust like many other government reports, and the stockpile will die a natural death over a period of time." But another highly placed metalman says he believes the lead and zinc programs will end next year.

It's felt in most quarters that

an end to the lead and zinc stockpile will hinge on whether the industry gets a protective tariff. "Without the stockpile or a tariff, stocks would zoom and prices fall," sums up an observer.

Even if some metals were taken off the essential list, it would not necessarily signal the end of stockpiling. There is a possibility the committee would recommend some of the glamour metals, like boron, be stockpiled for defense reasons.

Metal Earnings Off

A look at the nonferrous industry's earnings for the first nine months shows that profits are off in almost all categories. Falling metal prices is the reason most often quoted; the slump in demand rates a close second. The increasing costs of labor and supplies have also hurt many firms.

Enough Nickel

Domestic availability of nickel for civilian use is reported to be at an all-time high. No complaints are being received in Washington about lack of supply. (It's rumored that consumers' stocks stand close to 45 million lb.) In fact, industry sources admit it's almost impossible to sell the premium grade.

Look for a boost in consumption by 1958's third quarter. Reason: The aircraft industry is living off its nickel inventories. Washington observers believe the Defense Department will have to come into the market for substantial tonnages by then.

Palladium: \$21-24 per troy oz.

Platinum: \$81-87 per troy oz from refineries.

Radium: \$16-21.50 per mg radium content, depending on quantity.

Rhodium: \$118-125 per troy oz.

Ruthenium: \$45-55 per troy oz.

Selenium: \$10.50 per lb, commercial grade.

Silver: Open market, 90.625 per troy oz.

Sodium: 16.50, c.l.; 17.00 l.c.l.

Tantalum: Rod, \$60 per lb; sheet, \$55 per lb.

Tellurium: \$1.65-1.85 per lb.

Thallium: \$12.50 per lb.

Tin: Straits, N. Y., spot and prompt, 91.00.

Titanium: Sponge, 99.3+ %, grade A-1 ductile (0.3% Fe max.), \$2.25; grade A-2 (0.5% Fe max.), \$2.00 per lb.

Tungsten: Powder, 98.8%, carbon reduced, 1000-lb lots, \$3.50 per lb nom., f.o.b. shipping point; less than 1000 lb, add 15.00; 99+ % hydrogen reduced, \$4.10-4.20.

Zinc: Prime Western, 10.00; brass special, 10.25; intermediate, 10.50, East St. Louis, freight allowed over 0.50 per lb. New York basis, add 0.50. High grade, 11.35; special high grade, 11.75 deld. Die casting alloy ingot No. 3, 14.25; No. 2, 15.25; No. 5, 14.75 deld.

Zirconium: Sponge, commercial grade, \$5-10 per lb.

(Note: Chromium, manganese, and silicon met- als are listed in ferroalloy section.)

SECONDARY METALS AND ALLOYS

Aluminum Ingot: Piston alloys, 23.75-30.25; No. 12 foundry alloy (No. 2 grade), 21.75-23.00; 5% silicon alloy, 0.60 Cu max., 25.50-26.00; 13 alloy, 0.60 Cu max., 25.50-26.00; 195 alloy, 24.75-26.75; 108 alloy, 22.25-23.00. Steel deoxidizing grades, notch bars, granu- lated or shot; Grade 1, 23.75; grade 2, 22.00; grade 3, 20.75; grade 4, 19.00.

Brass Ingot: Red brass, No. 115, 26.75; tin bronze, No. 225, 36.00; No. 245, 30.25; high- leaded tin bronze, No. 305, 30.75; No. 1 yellow, No. 405, 22.00; manganese bronze, No. 421, 24.50.

Magnesium Alloy Ingot: AZ63A, 40.75; AZ91B, 37.25; AZ91C, 40.75; AZ92A, 40.75.

NONFERROUS PRODUCTS

BERYLLIUM COPPER

(Base prices per lb, plus mill extras, 2000 to 5000 lb; nom. 1.9% Be alloy.) Strip, \$1.82, f.o.b. Temple, Pa., or Reading, Pa.; rod, bar, wire, \$1.80, f.o.b. Temple, Pa.

COPPER WIRE

Bare, soft, f.o.b. eastern mills, 30,000-lb lots, 32.355; l.c.l., 32.98. Weatherproof, 30,000-lb lots, 33.66; l.c.l., 34.78. Magnet wire deld., 40.43, before quantity discounts.

LEAD

(Prices to jobbers, f.o.b. Buffalo, Cleveland, Pittsburgh.) Sheets, full rolls, 140 sq ft or more, \$19.00 per cwt; pipe, full coils, \$19.00 per cwt; traps and bends, list prices plus 30%.

TITANIUM

(Prices per lb, 10,000 lb and over, f.o.b. mill.) Sheets and strip, \$9.50-15.95; sheared mill plate, \$8.00-11.50; wire, \$7.50-11.50; forging billets, \$6.00-7.60; hot-rolled and forged bars, \$6.15-7.90.

ZINC

(Prices per lb, c.l., f.o.b. mill.) Sheets, 24.00; ribbon zinc in coils, 20.50; plates 19.00.

ZIRCONIUM

Plate, \$12.50-19.20; H.R. strip, \$12.50-22.90; C.R. strip, \$15.00-31.25; forged or H.R. bars, \$11.00-17.40.

PLATING MATERIALS

(F.o.b. shipping point, freight allowed on quantities)

ANODES

Cadmium: Special or patented shapes, \$1.70 per lb.

Copper: Flat-rolled, 45.29; oval, 43.50, 5000-10,000 lb; electrodeposited, 35.75, 2000-5000 lb lots; cast, 36.25, 5000-10,000 lb quantities.

Nickel: Depolarized, less than 100 lb, 114.25; 100-499 lb, 112.00; 500-4999 lb, 107.50; 5000-29,999 lb, 105.25; 30,000 lb, 103.00. Carbonized, deduct 3 cents a lb.

Tin: Bar or slab, less than 200 lb, 109.50; 200-499 lb, 108.00; 500-999 lb, 107.50; 1000 lb or more, 107.00.

Zinc: Balls, 17.50; flat tops, 17.50; flats, 19.25; ovals, 18.50, ton lots.

CHEMICALS

Cadmium Oxide: \$1.70 per lb in 100-lb drums.

Chromic Acid: 100 lb, 33.30; 500 lb, 32.80; 2000 lb, 32.15; 5000 lb, 31.80; 10,000 lb, 31.30; f.o.b. Detroit.

Copper Cyanide: 100-200 lb, 71.60; 300-900 lb, 69.60.

Copper Sulphate: 100-1900 lb, 14.55; 2000-5900 lb, 12.55; 6000-11,900 lb, 12.30; 12,000-22,900 lb, 12.05; 23,000 lb or more, 11.55.

Nickel Chloride: Less than 400 lb, 35.00; 400-9990 lb, 33.00; 10,000 lb, 32.50.

Nickel Sulphate: 5000-22,000 lb, 33.50; 23,000-35,900 lb, 33.00; 36,000 lb or more, 32.50.

Sodium Cyanide: 100 lb, 27.60; 200 lb, 25.90; 400 lb, 22.90; 1000 lb, 21.90; f.o.b. Detroit.

Sodium Stannate: Less than 100 lb, 73.70; 100-600 lb, 64.80; 700-1900 lb, 62.00; 2000-9900 lb, 60.20; 10,000 lb or more, 58.90.

Stannous Chloride (anhydrous): Less than 25 lb, 162.90; 25 lb, 127.90; 100 lb, 112.90; 400 lb, 110.40; 5200-19,600 lb, 98.20; 20,000 lb or more, 86.00.

Stannous Sulphate: Less than 50 lb, 125.80; 50 lb, 95.80; 100-1900 lb, 93.80; 2000 lb or more, 91.80.

Zinc Cyanide: 100-200 lb, 59.00; 300-900 lb, 57.00.

(Concluded from Page 189)

tric furnaces are out of the market. Some indicate they may begin buying limited quantities this month.

A couple of ships are loading scrap for export on the Gulf Coast, but prices are reported to be the lowest in a long time.

Some dealers are pessimistic about any early pickup in quotations with district steel production still declining.

Seattle — The scrap market is marking time. Dealers estimate prices are down another \$1, but

quotations are nominal with representative sales lacking. Consumers are well stocked.

Oriental buyers are hard pressed financially, but Japanese stocks are low and exporters here anticipate some business from that area at the turn of the year.

Los Angeles—Scrap prices have nose-dived here, the market being down \$4 a ton on the average. No. 1 heavy melting steel is off \$5, now being quoted at \$39. No. 2 heavy melting also is off \$5 at \$37. Machine shop turnings dropped \$11, being quoted at \$20.

Help Wanted

STEEL CASTING SALES ENGINEER

Challenging opportunity for experienced salesman. Practical foundry and technical background required. Location Northeast. Age range 35 to 45. Salary plus commission, plus expenses. Reply with complete resume to Box 592, STEEL, Penton Bldg., Cleveland 13, Ohio.

Positions Wanted

COLD STRIP man desires to locate with medium size mill as Asst Superintendent or better. 24 years experience cold rolling steel and aluminum, the last 15 years in supervision as foreman and gen. foreman. Resume on request. Reply Box 612, STEEL, Penton Bldg., Cleveland 13, Ohio.

MECHANICAL ENGINEER, 43, graduate, 20 yrs. experience plant engineering, forward planning, design, specifications, new construction in seamless and welded tube mills and related plant facilities. Desires to relocate as dept. head or administrative assistant. Midwest or far west preferred. Appropriate responses acknowledged. Reply Box 602, STEEL, Penton Bldg., Cleveland 13, Ohio.

WANTED

BAR MILL SUPERINTENDENT

Experienced, all grades of steel. Capable of assuming full responsibility. In reply enclose full resume giving experience, background, availability, age and salary requirement.

Reply Box 611, STEEL
Penton Bldg. Cleveland 13, Ohio

POSITION OPEN

Experienced estimator flat die forgings. Location Western Pennsylvania. Enclose resume of background. Replies confidential. Immediate placement.

Reply Box 613, STEEL
Penton Bldg. Cleveland 13, Ohio

LOOKING FOR SURPLUS MACHINERY?

By checking the classified pages of STEEL each week you'll be able to find many different types of equipment which will fit your requirements. Used or surplus equipment—you can best find it in STEEL's classified columns.

Galvanizing Worries?

End Them by Contacting—
National Galvanizing Company

Who will:

1. Do your galvanizing for you in the world's most modern and efficient galvanizing plant (which we would like you to consider your own private galvanizing department).

OR

2. Build and operate complete job galvanizing facilities in your city.

OR

3. Engineer and install modern, low-cost facilities to replace outmoded galvanizing operations.
